CHAPTER 1

Welcome to AEIf's official documentation.

This site is where we centralize our guides, documents and api references. Wether you're a dApp developer looking to build some awesome apps on top of AEIf or simply just interested in seeing what a running node looks like, this place is for you!

As of today the documentation is correct but still a work in progress so we invite you to frequently visit and discover any new content.

Development Environment

2.1 Install

Before you get started with the tutorials, you need to install the following tools and frameworks.

For most of these dependencies, we provide command line instructions for macOS, Linux Ubuntu 18, and Windows. In case any problems occur or if you have more complex needs, please leave a message on GitHub and we will handle it ASAP.

2.1.1 macOS

Configure Environment

You can install and set up the development environment on macOS computers with either Intel or Apple M1 processors. This will take 10-20 minutes.

Before You Start

Before you install and set up the development environment on a macOS device, please make sure that your computer meets these basic requirements:

- Operating system version is 10.7 Lion or higher.
- At least a 2Ghz processor, 3Ghz recommended.
- At least 8 GB RAM, 16 GB recommended.
- No less than 10 GB of available space.
- Broadband internet connection.

Support for Apple M1

If you use a macOS computer with an Apple M1 chip, you need to install Apple Rosetta. Open the Terminal on your computer and execute this command, Please be patient while the command is executed.

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

Install Homebrew

In most cases, you should use Homebrew to install and manage packages on macOS devices. If Homebrew is not installed on your local computer yet, you should download and install it before you continue.

To install Homebrew:

- 1. Open Terminal.
- 2. Execute this command to install Homebrew:

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/

→HEAD/install.sh)"
```

3. Execute this command to check if Homebrew is installed:

```
brew --version
```

The following output suggests successful installation:

```
Homebrew 3.3.1

Homebrew/homebrew-core (git revision c6c488fbc0f; last commit 2021-10-30)

Homebrew/homebrew-cask (git revision 66bab33b26; last commit 2021-10-30)
```

Environment Update

Execute this command to update your environment:

```
brew update
```

You will see output like this.

```
You have xx outdated formula installed.
You can upgrade it with brew upgrade
or list it with brew outdated.
```

You can execute the following command to upgrade or skip to the installation of Git.

```
brew upgrade
```

Install Git

If you want to use our customized smart contract development environment or to run a node, you need to clone aelf's repo (download source code). As aelf's code is hosted on GitHub, you need to install **Git** first.

1. Execute this command in Terminal:

```
brew install git
```

2. Execute this command to check if Git is installed:

```
git --version
```

The following output suggests successful installation:

```
git version xx.xx.xx
```

Install .NET SDK

As aelf is mostly developed with .NET Core, you need to download and install .NET Core SDK (Installers - x64 recommended for macOS devices with Intel processors; Installers - Arm64 recommended for macOS devices with M1 chips).

- 1. Download and install .NET 6.0 which is currently used in aelf's repo.
- 2. Please reopen Terminal after the installation is done.
- 3. Execute this command to check if .NET is installed:

```
dotnet --version
```

The following output suggests successful installation:

```
6.0.403
```

Install protoBuf

1. Execute this command to install protoBuf:

```
brew install protobuf
```

If it shows error Permission denied @ apply2files, then there is a permission issue. You can solve it using the following command and then redo the installation with the above command:

```
sudo chown -R $(whoami) $(brew --prefix)/*
```

2. Execute this command to check if protoBuf is installed:

```
protoc --version
```

The following output suggests successful installation:

```
libprotoc 3.21.9
```

Install Redis

1. Execute this command to install Redis:

```
brew install redis
```

2.1. Install 5

2. Execute this command to start a Redis instance and check if Redis is installed:

```
redis-server
```

The following output suggests Redis is installed and a Redis instance is started:

Install Nodejs

1. Execute this command to install Nodejs:

```
brew install node
```

2. Execute this command to check if Nodejs is installed:

```
npm --version
```

The following output suggests successful installation:

```
6.14.8
```

2.1.2 Linux

Configure Environment

You can install and set up the development environment on computers running 64-bit Linux. This will take 10-20 minutes.

Before You Start

Before you install and set up the development environment on a Linux device, please make sure that your computer meets these basic requirements:

- Ubuntu 18.
- Broadband internet connection.

Update Environment

Execute this command to update your environment, Please be patient while the command is executed:

```
sudo apt-get update
```

The following output suggests successful update:

```
Fetched 25.0 MB in 3s (8,574 kB/s)
Reading package lists... Done
```

Install Git

If you want to use our customized smart contract development environment or to run a node, you need to clone aelf's repo (download source code). As aelf's code is hosted on GitHub, you need to install **Git** first.

- 1. Open the terminal.
- 2. Execute this command to install Git:

```
sudo apt-get install git -y
```

3. Execute this command to check if Git is installed:

```
git --version
```

The following output suggests successful installation:

```
git version 2.17.1
```

Install .NET SDK

As aelf is mostly developed with .NET Core, you need to download and install .NET Core SDK.

- 1. Execute the following commands to install .NET 6.0.
 - 1. Execute this command to download .NET packages:

```
wget https://packages.microsoft.com/config/ubuntu/22.04/packages-microsoft-

-prod.deb -0 packages-microsoft-prod.deb
```

2. Execute this command to unzip .NET packages:

```
sudo dpkg -i packages-microsoft-prod.deb
rm packages-microsoft-prod.deb
```

2.1. Install

3. Execute this command to install .NET:

```
sudo apt-get update && \
sudo apt-get install -y dotnet-sdk-6.0
```

2. Execute this command to check if .NET 6.0 is installed:

```
dotnet --version
```

The following output suggests successful installation:

```
6.0.403
```

Install protoBuf

Before you start the installation, please check the directory you use and execute the following commands to install.

- 1. Execute the following commands to install protoBuf.
 - 1. Execute this command to download protoBuf packages:

```
curl -OL https://github.com/google/protobuf/releases/download/v21.9/protoc-21. \hookrightarrow 9-linux-x86_64.zip
```

2. Execute this command to unzip protoBuf packages:

```
unzip protoc-21.9-linux-x86_64.zip -d protoc3
```

3. Execute these commands to install protoBuf:

```
sudo mv protoc3/bin/* /usr/local/bin/
sudo mv protoc3/include/* /usr/local/include/
sudo chown ${USER} /usr/local/bin/protoc
sudo chown -R ${USER} /usr/local/include/google
```

If it shows error Permission denied @ apply2files, then there is a permission issue. You can solve it using the following command and then redo the installation with the above commands:

```
sudo chown -R $(whoami) $(brew --prefix)/*
```

2. Execute this command to check if protoBuf is installed:

```
protoc --version
```

The following output suggests successful installation:

```
libprotoc 3.21.9
```

Install Redis

1. Execute this command to install Redis:

```
sudo apt-get install redis -y
```

2. Execute this command to start a Redis instance and check if Redis is installed:

```
redis-server
```

The following output suggests Redis is installed and a Redis instance is started:

```
Server initialized
Ready to accept connections
```

You can open a new terminal and use redis-cli to start Redis command line. The command below can be used to clear Redis cache (be careful to use it):

```
flushall
```

Install Nodejs

1. Execute these commands to install Nodejs:

```
curl -fsSL https://deb.nodesource.com/setup_14.x | sudo -E bash -
sudo apt-get install -y nodejs
```

2. Execute this command to check if Nodejs is installed:

```
npm --version
```

The following output suggests successful installation:

```
6.14.8
```

2.1.3 Windows

Configure Environment

You can install and set up the development environment on computers running Windows 10 or higher. This will take 10-20 minutes.

Before You Start

Before you install and set up the development environment on a Windows device, please make sure that your computer meets these basic requirements:

- Operating system version is Windows 10 or higher.
- Broadband internet connection.

2.1. Install 9

Install Chocolatey (Recommended)

Chocolatey is an open-source package manager for Windows software that makes installation simpler, like Homebrew for Linux and macOS. If you don't want to install it, please use the provided download links for each software to complete their installation.

- 1. Open **cmd** or **PowerShell** as administrator (Press Win + x).
- 2. Execute the following commands in order and enter y to install Chocolatey, Please be patient while the command is executed:

```
Set-ExecutionPolicy AllSigned

Set-ExecutionPolicy Bypass -Scope Process

Set-ExecutionPolicy Bypass -Scope Process -Force; iex ((New-Object System.Net.

WebClient).DownloadString('https://chocolatey.org/install.ps1'))

Set-ExecutionPolicy RemoteSigned
```

3. Execute this command to check if Chocolatey is installed:

```
choco
```

The following output suggests successful installation:

```
Chocolatey vx.x.x
```

If it showsThe term 'choco' is not recognized as the name of a cmdlet, function, script file, or operable program, then there is a permission issue with PowerShell. To solve it:

- Right-click the computer icon and select Properties.
- Click Advanced in System Properties and select Environment Variables on the bottom right.
- Check if the ChocolateyInstall variable is in System variables, and its default value is the Chocolatey installation path C:\Program Files\Chocolatey. If you don't find it, click New System Variable to manually add it.

Install Git

If you want to use our customized smart contract development environment or to run a node, you need to clone aelf's repo (download source code). As aelf's code is hosted on GitHub, you need to install **Git** first.

1. You can download Git through this link or execute this command in cmd or PowerShell:

```
choco install git -y
```

2. Execute this command to check if Git is installed:

```
git --version
```

The following output suggests successful installation:

```
git version xx.xx.xx
```

If it shows The term 'git' is not recognized as the name of a cmdlet, function, script file, or operable program, you can:

- **Right-click** the computer icon and select **Properties**.
- Click Advanced in System Properties and select Environment Variables on the bottom right.
- Check if the Git variable is in **Path** in **System variables**, and its default value is the Git installation path C:\Program Files\git. If you don't find it, click **New System Variable** to manually add it.

Install .NET SDK

As aelf is mostly developed with .NET Core, you need to download and install .NET Core SDK (Installers - x64 recommended for Windows devices).

- 1. Download and install .NET 6.0 which is currently used in aelf's repo.
- 2. Please reopen cmd or PowerShell after the installation is done.
- 3. Execute this command to check if .NET is installed:

```
dotnet --version
```

The following output suggests successful installation:

```
6.0.403
```

Install protoBuf

1. You can download protoBuf through this link or execute this command in cmd or PowerShell:

```
choco install protoc --version=3.11.4 -y
choco install unzip -y
```

2. Execute this command to check if protoBuf is installed:

```
protoc --version
```

The following output suggests successful installation:

```
libprotoc 3.21.9
```

Install Redis

1. You can download Redis through MicroSoftArchive-Redis or execute this command in cmd or PowerShell:

```
choco install redis-64 -y
```

2. Execute this command to start a Redis instance and check if Redis is installed:

```
memurai
```

The following output suggests Redis is installed and a Redis instance is started:

2.1. Install 11

Install Nodeis

1. You can download Nodejs through Node.js or execute this command in cmd or PowerShell:

```
choco install nodejs -y
```

2. Execute this command to check if Nodejs is installed:

```
npm --version
```

The following output suggests successful installation:

```
6.14.8
```

If it shows The term 'npm' is not recognized as the name of a cmdlet, function, script file, or operable program, you can:

- Right-click the computer icon and select Properties.
- · Click Advanced in System Properties and select Environment Variables on the bottom right.
- Check if the Nodejs variable is in **Path** in **System variables**, and its default value is the Nodejs installation path C:\Program Files\nodejs. If you don't find it, click **New System Variable** to manually add it.

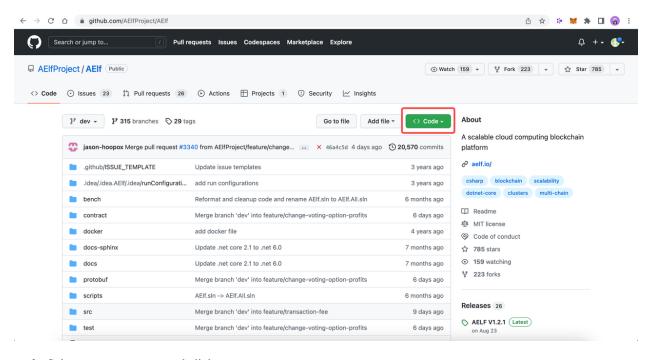

2.1.4 Codespaces

A codespace is an instant development environment that's hosted in the cloud. It provides users with general-purpose programming languages and tooling through containers. You can install and set up the development environment in

Codespaces. This will take 10-20 minutes. Please be patient while the command is executed.

Basic Environment Configurations

- 1. Visit AElfProject / AElf via a browser.
- 2. Click the green **Code** button on the top right.

3. Select Codespaces and click +.

Then a new tab will be opened that shows the Codespaces interface. After the page is loaded, you will see:

- The left side displays all the content in this repo.
- The upper right side is where you can write code or view text.
- The lower right side is a terminal where you can build and run code (If the terminal doesn't open by default, you can click the hamburger menu on the top left and select Terminal -> New Terminal, or press control + shift + 'on your keyboard).

Currently, Codespaces have completed the configuration for part of the environments, yet there are some you need to manually configure.

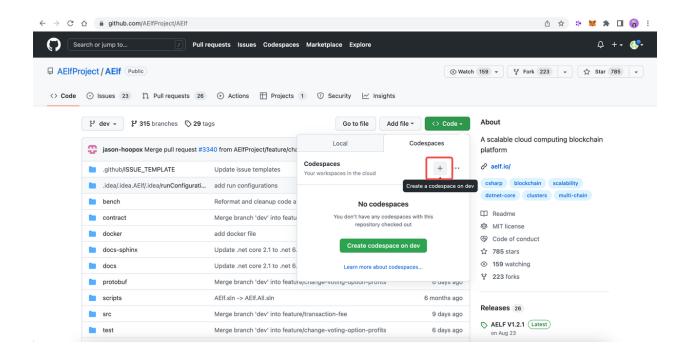

At the time of writing, Codespaces have done the configuration for git and nodejs. You can type the following commands to check their versions:

```
# git version 2.25.1
git --version
# 8.19.2
npm --version
```

Update Environment

Execute this command to update your environment:

2.1. Install 13

sudo apt-get update

The following output suggests successful update:

```
Fetched 25.0 MB in 3s (8,574 kB/s)
Reading package lists... Done
```

Install .NET SDK

.NET SDK 7.0 is used in this repo. Hence, you need to reinstall v6.0 otherwise there will be building issues.

1. Execute this command to check if v7.0 is used:

```
# 7.0.100
dotnet --version
```

If there is v7.0, execute this command to delete it:

```
sudo rm -rf /home/codespace/.dotnet/*
```

2. Execute this command to reinstall v6.0:

3. Restart bash after the installation and execute this command to check if v6.0 is installed:

```
# 6.0.403
dotnet --version
```

The following output suggests successful installation:

```
6.0.403
```

Install protoBuf

1. Execute this command to install protoBuf:

```
curl -OL https://github.com/google/protobuf/releases/download/v21.9/protoc-21.9-
-linux-x86_64.zip
unzip protoc-21.9-linux-x86_64.zip -d protoc3

sudo mv protoc3/bin/* /usr/local/bin/
sudo mv protoc3/include/* /usr/local/include/
sudo chown ${USER} /usr/local/bin/protoc

sudo chown -R ${USER} /usr/local/include/google
```

2. Execute this command to check if protoBuf is installed:

```
protoc --version
```

The following output suggests successful installation:

```
libprotoc 3.21.9
```

Install Redis

1. Execute this command to install Redis:

```
sudo apt-get install redis -y
```

2. Execute this command to start a Redis instance and check if Redis is installed:

```
redis-server
```

The following output suggests Redis is installed and a Redis instance is started:

```
Server initialized
Ready to accept connections
```

What's Next

If you have already installed the tools and frameworks above, you can skip this step. For info about contract deployment and nodes running, please read the following:

2.1. Install 15

Smart contract development

Smart contract deployment

Node

2.2 Node

If you already know something about aelf blockchain and want to get deeply involved, you can proceed with the following and run your own node.

If you are a beginner or you want to deploy contracts onto aelf, please click here to learn more.

Why Should I Run a Node

- Full node: A full node stores the complete blockchain data and you can view all the info. It also enables you to deploy DApps and contracts on aelf or interact with its contracts.
- BP: To run a full node that produces blocks, the node needs to participate in the election. If ranked among the top 2N+1 (N=8 in the first year and increases by 1 every year. Currently the threshold is 17), it can get involved in the governance of aelf.

Next, we will show you how to deploy nodes.

2.2.1 Single Node

macOS

Follow this doc to run an aelf single node on a macOS device and this will take around 20 minutes to complete.

Install aelf-command

Execute this command to install aelf-command:

```
npm i aelf-command -g
```

The following output suggests successful installation:

```
+ aelf-command@0.1.44
added 314 packages from 208 contributors in 25.958s
```

Besides, you might see warnings like this due to differences in system configuration. Please ignore it.

```
npm WARN deprecated debug@4.1.1: Debug versions >=3.2.0 <3.2.7 || >=4 <4.3.1 have a low-severity ReDos regression when used in a Node.js environment. It is recommended you upgrade to 3.2.7 or 4.3.1. (https://github.com/visionmedia/debug/issues/797)

npm WARN deprecated uuid@3.4.0: Please upgrade to version 7 or higher. Older versions may use Math.random() in certain circumstances, which is known to be problematic. See https://v8.dev/blog/math-random for details.

changed 324 packages in 39s

35 packages are looking for funding run `npm fund` for details
```

If it shows error Permission denied @ apply2files, then there is a permission issue. You can solve it using the following command and then redo the installation with the above command:

```
sudo chmod 755 /usr/local/lib/node_modules
```

Clone and Build aelf's Code

Create a directory. This tutorial uses a directory on the desktop for reference.

1. Execute this command to create a directory:

```
mkdir ~/Desktop/Code
```

2. Execute this command to change the directory:

```
cd ~/Desktop/Code
```

3. Execute this command to clone aelf's code:

```
git clone https://github.com/AElfProject/AElf.git
```

4. Execute this command to change to aelf's directory:

```
cd AElf
```

5. Execute this command to restore aelf's files:

```
dotnet restore AElf.All.sln
```

6. Execute this command to build aelf's code (this will take several minutes):

```
dotnet build AElf.All.sln
```

The following output suggests successful building:

```
xx Warning(s)
0 Error(s)
Time Elapsed 00:15:59.77
```

If contract_csharp_plugin fails to be called, it may be because you don't have Rosetta 2 installed. Please execute this command and then retry:

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

Create an aelf Account

Execute this command:

```
aelf-command create
```

An aelf account will be automatically created and you will see info like:

```
AElf [Info]: Your wallet info is:

AElf [Info]: Mnemonic : mirror among battle muffin cattle plunge tuition ...

→buzz hip mad surround recall

AElf [Info]: Private Key : ...

→4bf625afea60e21aa5afcab5ea682b3dfb614941245698632d72a09ae13***** (continues on next page)
```

(continued from previous page)

```
AElf [Info]: Public Key :_ 
→04f9bb56a9eca921bd494e677307f0279c98f1d2ed6bdeaa6dd256878272eabd14e91ec61469d2a32ce5e63205930dabdcd
AElf [Info]: Address : 21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p******
```

You will then be asked whether you want the account data stored as a json file. Enter y to confirm and the file will be stored in /Users/{username}/.local/share/aelf/keys/.

Please make sure you remember the account data or the json file's location.

You will be required to set a password (referred to as * here):

```
Enter a password: *******
Confirm password: *******
```

For the sake of convenience, you are encouraged to keep this Terminal on the account info interface and open another Terminal to continue the following.

Run a Single Node

A single node runs aelf blockchain on one node. It is usually used to test the execution of contracts only.

1. Execute this command to start a Redis instance (skip this step if redis-server is already started):

```
redis-server
```

2. Open another Terminal and execute this command to change to aelf's directory:

```
cd ~/Desktop/Code/AElf
```

3. Execute this command to change to the AElf.Launcher directory:

```
cd src/AElf.Launcher
```

4. Modify the appsettings.json file: for novices, you can go to desktop -> Code -> AElf -> src -> AElf.Launcher and open the appsettings.json file in the editor to modify it (or, if you are familiar with Linux commands, you can run the vim appsettings.json command and modify the file in the command-line interface).

Find the account data you just created using aelf-command create.

```
AElf [Info]: Your wallet info is:

AElf [Info]: Mnemonic : mirror among battle muffin cattle plunge tuition ...

buzz hip mad surround recall

AElf [Info]: Private Key : ...

4bf625afea60e21aa5afcab5ea682b3dfb614941245698632d72a09ae13****

AElf [Info]: Public Key : ...

04f9bb56a9eca921bd494e677307f0279c98f1d2ed6bdeaa6dd256878272eabd14e91ec61469d2a32ce5e63205930dabdcdaElf [Info]: Address : 21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****
```

Fill in the NodeAccount and NodeAccountPassword under Account using the Address and password you set in appsettings.json:

```
"Account": {
    "NodeAccount": "",
    "NodeAccountPassword": ""
}
```

It may look like this when you complete it:

```
"Account": {
    "NodeAccount": "21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****",
    "NodeAccountPassword": "*******"
},
```

Fill in the InitialMineList under Consensus using Public Key:

```
"Consensus": {
    "InitialMinerList": [],
    "MiningInterval": 4000,
    "StartTimestamp": 0,
    "PeriodSeconds": 604800,
    "MinerIncreaseInterval": 31536000
}
```

It may look like this when you complete it (make sure the key is bracketed):

```
"Consensus": {
    "InitialMinerList": [
    →"04f9bb56a9eca921bd494e677307f0279c98f1d2ed6bdeaa6dd256878272eabd14e91ec61469d2a32ce5e63205930dabdeed"],
    "MiningInterval": 4000,
    "StartTimestamp": 0,
    "PeriodSeconds": 604800,
    "MinerIncreaseInterval": 31536000
}
```

If the IP and port for Redis have been changed, you can modify them under ConnectionStrings in appsettings.json (skip this step if they are not changed):

```
"ConnectionStrings": {
    "BlockchainDb": "redis://localhost:6379?db=1",
    "StateDb": "redis://localhost:6379?db=1"
}
```

5. Execute dotnet run:

```
sudo dotnet run
```

The following output suggests successful execution:

```
2022-11-29 16:07:44,554 [.NET ThreadPool Worker] INFO AElf.Kernel.

→SmartContractExecution.Application.BlockExecutionResultProcessingService - Attach

→blocks to best chain, best chain hash:

→"f396756945d9bb883f81827ab36fcb0533d3c66f7062269700e49b74895*****", height: 177
```

If you want to check the node's block height and other block info, you can visit this page where you can access the API docs and interact with this single node.

To shut the node down, please use control + c on your keyboard.

If you don't want to save the data, you can execute this command to delete all:

```
redis-cli flushall
```

Linux and Codespaces

Follow this doc to run an aelf single node in Linux and Codespaces and this will take around 20 minutes to complete.

Install aelf-command

Execute this command to install aelf-command:

```
npm i aelf-command -g
```

The following output suggests successful installation:

```
+ aelf-command@0.1.44
added 314 packages from 208 contributors in 25.958s
```

You might see warnings like this due to differences in system configuration. Please ignore it:

```
npm WARN deprecated debug@4.1.1: Debug versions >=3.2.0 <3.2.7 || >=4 <4.3.1 have a low-severity ReDos regression when used in a Node.js environment. It is recommended you upgrade to 3.2.7 or 4.3.1. (https://github.com/visionmedia/debug/issues/797)

npm WARN deprecated uuid@3.4.0: Please upgrade to version 7 or higher. Older versions may use Math.random() in certain circumstances, which is known to be problematic. See https://v8.dev/blog/math-random for details.

changed 324 packages in 39s

35 packages are looking for funding run `npm fund` for details
```

Clone and Build aelf's Code

Create a directory. This tutorial uses a directory on the desktop for reference.

1. Execute this command to create a directory:

```
mkdir ~/Desktop/Code
```

2. Execute this command to change the directory:

```
cd ~/Desktop/Code
```

3. Execute this command to clone aelf's code:

```
git clone https://github.com/AElfProject/AElf.git
```

4. Execute this command to change to aelf's directory:

```
cd AElf
```

5. Execute this command to restore aelf's files:

```
dotnet restore AElf.All.sln
```

6. Execute this command to build aelf's code (this will take several minutes):

```
dotnet build AElf.All.sln
```

Chapter 2. Development Environment

The following output suggests successful building:

```
xx Warning(s)
0 Error(s)
Time Elapsed 00:15:59.77
```

Create an aelf Account

Execute this command:

```
aelf-command create
```

An aelf account will be automatically created and you will see info like:

```
AElf [Info]: Your wallet info is:

AElf [Info]: Mnemonic : mirror among battle muffin cattle plunge tuition...

buzz hip mad surround recall

AElf [Info]: Private Key :...

4bf625afea60e21aa5afcab5ea682b3dfb614941245698632d72a09ae13****

AElf [Info]: Public Key :...

404f9bb56a9eca921bd494e677307f0279c98f1d2ed6bdeaa6dd256878272eabd14e91ec61469d2a32ce5e63205930dabdcd

AElf [Info]: Address : 21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****
```

You will then be asked whether you want the account data stored as a json file. Enter y to confirm and the file will be stored in /root/.local/share/aelf/keys/.

Please make sure you remember the account data or the json file's location.

You will be required to set a password (referred to as * here):

```
Enter a password: *******
Confirm password: ******
```

For the sake of convenience, you are encouraged to keep this Terminal on the account info interface and open another Terminal to continue the following.

Run a Single Node

A single node runs aelf blockchain on one node. It is usually used to test the execution of contracts only.

1. Execute this command to start a Redis instance (skip this step if redis-server is already started):

```
redis-server
```

2. Open another Terminal and execute this command to change to aelf's directory:

```
cd ~/Desktop/Code/AElf
```

3. Execute this command to change to the AElf.Launcher directory:

```
cd src/AElf.Launcher
```

4. Modify the appsettings.json file: for novices, you can go to desktop -> Code -> AElf -> src -> AElf.Launcher and open the appsettings.json file in the editor to modify it (or, if you are familiar with Linux commands, you can run the vim appsettings.json command and modify the file in the command-line interface).

Find the account data you just created using aelf-command create.

```
AElf [Info]: Your wallet info is:
AElf [Info]: Mnemonic : mirror among battle muffin cattle plunge tuition_

-buzz hip mad surround recall
AElf [Info]: Private Key :_

-4bf625afea60e21aa5afcab5ea682b3dfb614941245698632d72a09ae13****

```

Fill in the NodeAccount and NodeAccountPassword under Account using the Address and password you set in appsettings.json:

```
"Account": {
    "NodeAccount": "",
    "NodeAccountPassword": ""
}
```

It may look like this when you complete it:

```
"Account": {
    "NodeAccount": "21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****",
    "NodeAccountPassword": "*******"
},
```

Fill in the InitialMineList under Consensus using Public Key:

```
"Consensus": {
    "InitialMinerList": [],
    "MiningInterval": 4000,
    "StartTimestamp": 0,
    "PeriodSeconds": 604800,
    "MinerIncreaseInterval": 31536000
}
```

It may look like this when you complete it (make sure the key is bracketed):

```
"Consensus": {
    "InitialMinerList": [
    →"04f9bb56a9eca921bd494e677307f0279c98f1d2ed6bdeaa6dd256878272eabd14e91ec61469d2a32ce5e63205930dabdefer"],
    "MiningInterval": 4000,
    "StartTimestamp": 0,
    "PeriodSeconds": 604800,
    "MinerIncreaseInterval": 31536000
}
```

If the IP and port for Redis have been changed, you can modify them under ConnectionStrings in appsettings.json (skip this step if they are not changed):

```
"ConnectionStrings": {
    "BlockchainDb": "redis://localhost:6379?db=1",
    "StateDb": "redis://localhost:6379?db=1"
}
```

Save the changes and keep them in the AElf. Launcher directory.

5. Execute dotnet run:

```
sudo dotnet run
```

The following output suggests successful execution:

```
2022-11-29 16:07:44,554 [.NET ThreadPool Worker] INFO AElf.Kernel.

→SmartContractExecution.Application.BlockExecutionResultProcessingService - Attach

→blocks to best chain, best chain hash:

→"f396756945d9bb883f81827ab36fcb0533d3c66f7062269700e49b74895*****", height: 177
```

If you want to check the node's block height and other block info, you can visit this page where you can access the API docs and interact with this single node.

To shut the node down, please use control + c on your keyboard.

If you don't want to save the data, you can execute this command to delete all:

```
redis-cli flushall
```

Windows

Follow this doc to run an aelf single node on a Windows device and this will take around 20 minutes to complete.

Install aelf-command

Execute npm command to install aelf-command:

```
npm i aelf-command -g
```

The following output suggests successful installation:

```
+ aelf-command@0.1.44
added 314 packages from 208 contributors in 25.958s
```

You might see warnings like this due to differences in system configuration. Please ignore it:

```

npm WARN deprecated uuid@3.4.0: Please upgrade to version 7 or higher. Older versions may use Math.random() in certain circumstances, which is known to be problematic. See https://v8.dev/blog/math-random for details.

changed 324 packages in 39s

35 packages are looking for funding run `npm fund` for details
```

Clone and Build aelf's Code

Create a directory. This tutorial uses a directory on the desktop for reference.

1. Execute this command in cmd or PowerShell to create a directory:

```
mkdir C:/Users/${username}/Desktop/Code
```

2. Execute this command to change the directory:

```
cd C:/Users/${username}/Desktop/Code
```

3. Execute this command to clone aelf's code:

```
git clone https://github.com/AElfProject/AElf.git
```

4. Execute this command to change to aelf's directory:

```
cd AElf
```

5. Execute this command to restore aelf's files:

```
dotnet restore AElf.All.sln
```

6. Execute this command to build aelf's code (this will take several minutes):

```
dotnet build AElf.All.sln
```

The following output suggests successful building:

```
xx Warning(s)
0 Error(s)
Time Elapsed 00:15:59.77
```

Create an aelf Account

Execute this command:

```
aelf-command create
```

An aelf account will be automatically created and you will see info like:

```
AElf [Info]: Your wallet info is:

AElf [Info]: Mnemonic : mirror among battle muffin cattle plunge tuition

buzz hip mad surround recall

AElf [Info]: Private Key :

AElf [Info]: Public Key :

404f9bb56a9eca921bd494e677307f0279c98f1d2ed6bdeaa6dd256878272eabd14e91ec61469d2a32ce5e63205930dabdc0

AElf [Info]: Address : 21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****
```

You will then be asked whether you want the account data stored as a json file. Enter y to confirm and the file will be stored locally.

Please make sure you remember the account data or the json file's location.

You will be required to set a password (referred to as * here):

```
Enter a password: *******
Confirm password: *******
```

For the sake of convenience, you are encouraged to keep this cmd or PowerShell on the account info interface and open another cmd or PowerShell to continue the following.

Run a Single Node

A single node runs aelf blockchain on one node. It is usually used to test the execution of contracts only.

1. Execute this command to start a Redis instance (skip this step if redis-server is already started):

```
redis-server
```

2. Open another cmd or PowerShell and execute this command to change to aelf's directory:

```
cd C:/Users/${username}/Desktop/Code
```

3. Execute this command to change to the AElf.Launcher directory:

```
cd src/AElf.Launcher
```

4. Modify the appsettings.json file: for novices, you can go to desktop -> Code -> AEIf -> src -> AEIf.Launcher and open the appsettings.json file in the editor to modify it (or you can run the start appsettings.json command and open the appsettings.json file in the editor).

Find the account data you just created using aelf-command create.

```
AElf [Info]: Your wallet info is:

AElf [Info]: Mnemonic : mirror among battle muffin cattle plunge tuition.

buzz hip mad surround recall

AElf [Info]: Private Key :

```

If you want to check the node's block height and other block info, you can visit this page where you can access the API docs and interact with this single node.

To shut the node down, please use control + c on your keyboard.

If you don't want to save the data, you can execute this command to delete all:

```
redis-cli flushall
```

2.2.2 Multi Nodes

macOS

Follow this doc to run aelf multi-nodes on a macOS device and this will take around 20 minutes to complete.

Run Multi-Nodes

This tutorial will guide you through how to run three nodes.

Publish aelf's Code

Create a directory. This tutorial uses a directory on the desktop for reference.

1. Execute this command to create a directory:

```
mkdir ~/Desktop/Out
```

2. Execute this command to change the directory:

```
cd ~/Desktop/Code/AElf
```

3. Execute this command to publish aelf's code (this will take several minutes):

```
sudo dotnet publish AElf.All.sln /p:NoBuild=false --configuration Debug -o \sim/Desktop/\hookrightarrowOut
```

Configure Three Nodes

1. Execute this command three times to create three accounts: A, B, and C.

```
aelf-command create
```

Please make sure you remember their Public Keys and Addresses.

Create a directory for node configuration. This tutorial uses a directory on the desktop for reference.

2. Execute this command to create a directory:

```
mkdir ~/Desktop/Config
```

3. Execute this command to change the directory:

```
cd ~/Desktop/Config
```

4. Execute this command to create three new directories: bp1, bp2, and bp3 in the "Config" directory and create their respective "keys" directories.

```
mkdir -p ~/Desktop/Config/bp1/keys
mkdir -p ~/Desktop/Config/bp2/keys
mkdir -p ~/Desktop/Config/bp3/keys
```

- 5. Copy account A, B, and C from /Users/{username}/.local/share/aelf/keys/ to bp1/keys, bp2/keys, and bp3/keys respectively (If you can't find .local, you can use cmd + shift + g in Finder to designate the directories).
- 6. Execute this command to create appsettings.json files and appsettings.MainChain.MainNet.json files in directories bp1, bp2, and bp3:

```
cd ~/Desktop/Config/bp1;touch appsettings.json;touch appsettings.MainChain.MainNet.

→ json

cd ~/Desktop/Config/bp2;touch appsettings.json;touch appsettings.MainChain.MainNet.

→ json
```

(continues on next page)

(continued from previous page)

cd ~/Desktop/Config/bp3;touch appsettings.json;touch appsettings.MainChain.MainNet.
→json

For appsettings.json:

```
"Logging": {
   "LogLevel": {
     "Default": "Debug"
   }
 },
 "AllowedHosts": "*",
 "CorsOrigins": "*",
 "ConnectionStrings": {
   "BlockchainDb": "redis://localhost:6379?db=1",
   "StateDb": "redis://localhost:6379?db=1"
 "ChainId": "AELF",
 "IsMainChain" : true,
 "NetType": "MainNet",
 "Account": {
   "NodeAccount": "21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****",
   "NodeAccountPassword": "******
 },
 "Network": {
   "BootNodes": [],
   "ListeningPort": 7001,
   "NetAllowed": "",
   "NetWhitelist": []
 },
 "Kestrel": {
   "EndPoints": {
     "Http": {
       "Url": "http://*:8001/"
     }
   }
 },
 "Runner": {
   "BlackList": [],
   "WhiteList": []
 "DeployServiceUrl": "",
 "Consensus": {
   "InitialMinerList" : [
→"04884d9563b3b67a589e2b9b47794fcfb3e15fa494053088dd0dc8a909dd72bfd24c43b0e2303d631683acaed34acf875
→"045670526219d73154847b1e9367be9af293601793c9f7e34a96336650c9c1104a4aac9aaee960af00e7†5dcd88048698
→"046a5913eae5fee3da9ee33604119f025a0ad45575dfed1257eff5da2c24e629845b1e1a131c5da87519†1d545cc5c038
\hookrightarrow "
   ],
   "MiningInterval" : 4000,
   "StartTimestamp": 0,
```

(continues on next page)

(continued from previous page)

```
"PeriodSeconds": 120
},
"BackgroundJobWorker":{
   "JobPollPeriod": 1
}
```

For appsettings.MainChain.MainNet.json:

```
"ChainId": "AELF",
"TokenInitial": {
    "Symbol": "ELF",
    "Name": "elf token",
    "TotalSupply": 1000000000,
    "Decimals": 2,
    "IsBurnable": true,
    "DividendPoolRatio": 0.2
},
"ElectionInitial": {
    "LockForElection": 100000,
    "TimeEachTerm": 2,
    "BaseTimeUnit": 2,
    "MinimumLockTime": 1,
    "MaximumLockTime": 2000
}
```

- 7. Modify the appsettings.json files in directory bp1, bp2, and bp3 as instructed:
 - 1. Change the numbers following db= in BlockchainDb and StateDb under ConnectionStrings:
 - 1. bp1: redis://localhost:6379?db=1
 - 2. bp2: redis://localhost:6379?db=2
 - 3. bp3: redis://localhost:6379?db=3
 - 2. Replace NodeAccount and NodeAccountPassword under Account with Address and password in account A, B, and C.
 - 3. Fill in all three InitialMineList under Consensus using account A, B, and C's Public Key, keys separated with,:

```
"Consensus": {
    "InitialMinerList" : [
    →"04884d9563b3b67a589e2b9b47794fcfb3e15fa494053088dd0dc8a909dd72bfd24c43b0e2303d631683acaed
    →",
    →"045670526219d73154847b1e9367be9af293601793c9f7e34a96336650c9c1104a4aac9aaee960af00e775dcd
    →",
    →"046a5913eae5fee3da9ee33604119f025a0ad45575dfed1257eff5da2c24e629845b1e1a131c5da8751971d54
    →"
    1,
```

4. In bp1, BootNodes is blank and ListeningPort is 7001. In bp2, BootNodes is 127.0.0. 1:7001 (make sure to bracket it), and ListeningPort is 7002. In bp3, BootNodes are 127.

- 0.0.1:7001 and 127.0.0.1:7002 (make sure to bracket them and separate them with ,) and ListeningPort is 7003.
- 5. Change the port numbers in Kestrel-EndPoints-Http-Url to 8001, 8002, and 8003 respectively (to ensure there is no conflict of ports).
- 8. Execute this command to start a Redis instance:

```
redis-server
```

Run Three Nodes

In this tutorial, code is published in \sim /Desktop/Out and the three nodes are configured in \sim /Desktop/Config.

Use redis-server to start a Redis instance.

We recommend you open three new Terminals to monitor the nodes' operation.

Execute this command to launch node 1:

```
cd ~/Desktop/Config/bp1;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

Execute this command to launch node 2:

```
cd ~/Desktop/Config/bp2;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

Execute this command to launch node 3:

```
cd ~/Desktop/Config/bp3;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

The three nodes run successfully if all Terminals show the following output:

```
2022-11-30 20:51:04,163 [.NET ThreadPool Worker] INFO AElf.Kernel.Miner.Application.

→MiningService - Generated block: { id:

→"12f519e1601dd9f755a186b1370fd12696a8c080ea04465dadc*******2463", height: 25 },

→previous: 5308de83c3585dbb4a097a9187a3b2f9b8584db4889d428484ca3e4df09e2860,

→executed transactions: 2, not executed transactions 0
```

To shut the nodes down, please use control + c on your keyboard.

If you don't want to save the data, you can execute this command to delete all:

```
redis-cli flushall
```

Linux and Codespaces

Follow this doc to run aelf multi-nodes in Linux and Codespaces and this will take around 20 minutes to complete.

Run Multi-Nodes

This tutorial will guide you through how to run three nodes.

Publish aelf's Code

Create a directory. This tutorial uses a directory on the desktop for reference.

1. Execute this command to create a directory:

```
mkdir ~/Desktop/Code
```

2. Execute this command to change the directory:

```
cd ~/Desktop/Code/AElf
```

3. Execute this command to publish aelf's code (this will take several minutes):

```
sudo dotnet publish AElf.All.sln /p:NoBuild=false --configuration Debug -o \sim/Desktop/\hookrightarrowOut
```

Configure Three Nodes

1. Execute this command three times to create three accounts: A, B, and C.

```
aelf-command create
```

Please make sure you remember their Public Keys and Addresses.

Create a directory for node configuration. This tutorial uses a directory on the desktop for reference.

2. Execute this command to create a directory:

```
mkdir ~/Desktop/Config
```

3. Execute this command to change the directory:

```
cd ~/Desktop/Config
```

4. Execute this command to create three new directories: bp1, bp2, and bp3 in the "Config" directory and create their respective "keys" directories.

```
mkdir -p ~/Desktop/Config/bp1/keys
mkdir -p ~/Desktop/Config/bp2/keys
mkdir -p ~/Desktop/Config/bp3/keys
```

- 5. Copy account A, B, and C from /root/.local/share/aelf/keys/ to bp1/keys, bp2/keys, and bp3/keys respectively (If you can't find .local, you can use cmd + shift + g in Finder to designate the directories).
- 6. Execute this command to create appsettings.json files and appsettings.MainChain.MainNet.json files in directories bp1, bp2, and bp3:

```
cd ~/Desktop/Config/bp1;touch appsettings.json;touch appsettings.MainChain.MainNet.

→ json

cd ~/Desktop/Config/bp2;touch appsettings.json;touch appsettings.MainChain.MainNet.

→ json
(continues on part page)
```

(continues on next page)

2.2. Node 31

```
cd \sim/Desktop/Config/bp3;touch appsettings.json;touch appsettings.MainChain.MainNet. \hookrightarrowjson
```

Copy the following templates to each file:

For appsettings.json:

```
"Logging": {
   "LogLevel": {
     "Default": "Debug"
 "AllowedHosts": "*",
 "CorsOrigins": "*",
 "ConnectionStrings": {
   "BlockchainDb": "redis://localhost:6379?db=1",
   "StateDb": "redis://localhost:6379?db=1"
 },
 "ChainId": "AELF",
 "IsMainChain" : true,
 "NetType": "MainNet",
 "Account": {
   "NodeAccount": "21qciGwcaowwBttKMjMk86AW6WajhcodSHytY1vCyZb7p*****",
   "NodeAccountPassword": "******
 "Network": {
   "BootNodes": [],
   "ListeningPort": 7001,
   "NetAllowed": "",
   "NetWhitelist": []
 },
 "Kestrel": {
   "EndPoints": {
     "Http": {
       "Url": "http://*:8001/"
     }
   }
 "Runner": {
   "BlackList": [],
   "WhiteList": []
 "DeployServiceUrl": "",
 "Consensus": {
   "InitialMinerList" : [
→ "04884d9563b3b67a589e2b9b47794fcfb3e15fa494053088dd0dc8a909dd72bfd24c43b0e2303d631683acaed34acf875
→"045670526219d73154847b1e9367be9af293601793c9f7e34a96336650c9c1104a4aac9aaee960af00e775dcd88048698
→"046a5913eae5fee3da9ee33604119f025a0ad45575dfed1257eff5da2c24e629845b1e1a131c5da87519†1d545cc5c038
   ],
```

```
"MiningInterval" : 4000,
   "StartTimestamp": 0,
   "PeriodSeconds": 120
},
   "BackgroundJobWorker":{
    "JobPollPeriod": 1
}
```

For appsettings.MainChain.MainNet.json:

```
"ChainId": "AELF",
"TokenInitial": {
    "Symbol": "ELF",
    "Name": "elf token",
    "TotalSupply": 1000000000,
    "Decimals": 2,
    "IsBurnable": true,
    "DividendPoolRatio": 0.2
},
"ElectionInitial": {
    "LockForElection": 100000,
    "TimeEachTerm": 2,
   "BaseTimeUnit": 2,
    "MinimumLockTime": 1,
    "MaximumLockTime": 2000
}
```

- 7. Modify the appsettings. json files in directory bp1, bp2, and bp3 as instructed:
 - 1. Change the numbers following db= in BlockchainDb and StateDb under ConnectionStrings:
 - 1. bp1: redis://localhost:6379?db=1
 - 2. bp2: redis://localhost:6379?db=2
 - 3. bp3: redis://localhost:6379?db=3
 - 2. Replace NodeAccount and NodeAccountPassword under Account with Address and password in account A, B, and C.
 - 3. Fill in all three InitialMineList under Consensus using account A, B, and C's Public Key, keys separated with,:

```
"Consensus": {
    "InitialMinerList" : [

    →"04884d9563b3b67a589e2b9b47794fcfb3e15fa494053088dd0dc8a909dd72bfd24c43b0e2303d631683acaeccett",

    →"045670526219d73154847b1e9367be9af293601793c9f7e34a96336650c9c1104a4aac9aaee960af00e775dccett",

    →"046a5913eae5fee3da9ee33604119f025a0ad45575dfed1257eff5da2c24e629845b1e1a131c5da8751971d54ecettt
    →"
    1,
```

2.2. Node 33

- 4. In bp1, BootNodes is blank and ListeningPort is 7001. In bp2, BootNodes is 127.0.0. 1:7001 (make sure to bracket it), and ListeningPort is 7002. In bp3, BootNodes are 127. 0.0.1:7001 and 127.0.0.1:7002 (make sure to bracket them and separate them with ,) and ListeningPort is 7003.
- 5. Change the port numbers in Kestrel-EndPoints-Http-Url to 8001, 8002, and 8003 respectively (to ensure there is no conflict of ports).
- 8. Execute this command to start a Redis instance:

```
redis-server
```

Run Three Nodes

In this tutorial, code is published in ~/Desktop/Out and the three nodes are configured in ~/Desktop/Config.

Use redis-server to start a Redis instance.

We recommend you open three new Terminals to monitor the nodes' operation.

Execute this command to launch node 1:

```
cd ~/Desktop/Config/bp1;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

Execute this command to launch node 2:

```
cd ~/Desktop/Config/bp2;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

Execute this command to launch node 3:

```
cd ~/Desktop/Config/bp3;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

The three nodes run successfully if all Terminals show the following output:

To shut the nodes down, please use control + c on your keyboard.

If you don't want to save the data, you can execute this command to delete all:

```
redis-cli flushall
```

Windows

Follow this doc to run aelf multi-nodes on a Windows device and this will take around 20 minutes to complete.

Run Multi-Nodes

This tutorial will guide you through how to run three nodes.

Publish aelf's Code

Create a directory. This tutorial uses a directory on the desktop for reference.

1. Execute this command to create a directory:

```
mkdir C:/Users/${username}/Desktop/Out
```

2. Execute this command to change the directory:

```
cd C:/Users/${username}/Desktop/Code/AElf
```

3. Execute this command to publish aelf's code (this will take several minutes):

Note: Be sure to replace \$ {username} here with your user name.

```
sudo dotnet publish AElf.All.sln /p:NoBuild=false --configuration Debug -o C:/Users/$ \rightarrow {username}/Desktop/Out
```

Configure Three Nodes

1. Execute this command three times to create three accounts: A, B, and C.

```
aelf-command create
```

Please make sure you remember their Public Keys and Addresses.

Create a directory for node configuration. This tutorial uses a directory on the desktop for reference.

2. Execute this command to create a directory:

```
mkdir C:/Users/${username}/Desktop/Config
```

3. Execute this command to change the directory:

```
cd C:/Users/${username}/Desktop/Config
```

4. Execute this command to create three new directories: bp1, bp2, and bp3 in the "Config" directory and create their respective "keys" directories.

```
mkdir -p C:/Users/${username}/Desktop/Config/bp1/keys
mkdir -p C:/Users/${username}/Desktop/Config/bp2/keys
mkdir -p C:/Users/${username}/Desktop/Config/bp3/keys
```

- 5. Copy account A, B, and C from their json files to bp1/keys, bp2/keys, and bp3/keys respectively.
- 6. Execute this command to create appsettings.json files and appsettings.MainChain.MainNet.json files in directories bp1, bp2, and bp3:

```
cd C:/Users/${username}/Desktop/Config/bp1;touch appsettings.json;touch appsettings.

→MainChain.MainNet.json

cd C:/Users/${username}/Desktop/Config/bp2;touch appsettings.json;touch appsettings.

→MainChain.MainNet.json
```

(continues on next page)

2.2. Node 35

cd C:/Users/ $\{username\}/Desktop/Config/bp3;touch appsettings.json;touch appsettings. <math display="inline">\rightarrow MainChain.MainNet.json$

Copy the following templates to each file:

For appsettings.json:

```
"Logging": {
   "LogLevel": {
     "Default": "Debug"

}
```

- 7. Modify the appsettings. json files in directory bp1, bp2, and bp3 as instructed:
 - 1. Change the numbers following db= in BlockchainDb and StateDb under ConnectionStrings:
 - 1. bp1: redis://localhost:6379?db=1
 - 2. bp2: redis://localhost:6379?db=2
 - 3. bp3: redis://localhost:6379?db=3
 - 2. Replace NodeAccount and NodeAccountPassword under Account with Address and password in account A, B, and C.
 - 3. Fill in all three InitialMineList under Consensus using account A, B, and C's Public Key, keys separated with,:

2.2. Node 37

- 4. In bp1, BootNodes is blank and ListeningPort is 7001. In bp2, BootNodes is 127.0.0. 1:7001 (make sure to bracket it), and ListeningPort is 7002. In bp3, BootNodes are 127. 0.0.1:7001 and 127.0.0.1:7002 (make sure to bracket them and separate them with ,) and ListeningPort is 7003.
- 5. Change the port numbers in Kestrel-EndPoints-Http-Url to 8001, 8002, and 8003 respectively (to ensure there is no conflict of ports).
- 8. Execute this command to start a Redis instance:

```
redis-server
```

Run Three Nodes

In this tutorial, code is published in C:/Users/\${username}/Desktop/Out and the three nodes are configured in C:/Users/\${username}/Desktop/Config.

Use redis-server to start a Redis instance.

We recommend you open three new terminals to monitor the nodes' operation.

Execute this command to launch node 1:

```
cd ~/Desktop/Config/bp1;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

Execute this command to launch node 2:

```
cd ~/Desktop/Config/bp2;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

Execute this command to launch node 3:

```
cd ~/Desktop/Config/bp3;dotnet ~/Desktop/Out/AElf.Launcher.dll
```

The three nodes run successfully if all Terminals show the following output:

```
2022-11-30 20:51:04,163 [.NET ThreadPool Worker] INFO AElf.Kernel.Miner.Application.

MiningService - Generated block: { id:

```

To shut the nodes down, please use control + c on your keyboard.

If you don't want to save the data, you can execute this command to delete all:

```
redis-cli flushall
```

Smart Contract Development

3.1 Greeter Contract

3.1.1 Smart contract implementation

This article will guide you through how to use **AEIf Boilerplate** to implement a smart contract. It takes an example on the **Greeter** contract that's already included in Boilerplate. Based on the concepts this article presents, you'll be able to create your own basic contract.

Greeter contract

The following content will walk you through the basics of writing a smart contract; this process contains essentially four steps:

- create the project: generate the contract template using AElf Boilerplate's code generator.
- **define the contract and its types**: the methods and types needed in your contract should be defined in a protobuf file, following typical protobuf syntax.
- generate the code: build the project to generate the base contract code from the proto definition.
- extend the generated code: implement the logic of the contract methods.

The Greeter contract is a very simple contract that exposes a Greet method that simply logs to the console and returns a "Hello World" message and a more sophisticated GreetTo method that records every greeting it receives and returns the greeting message as well as the time of the greeting.

This tutorial shows you how to develop a smart contract with the C# contract SDK; you can find you more *here*. Boilerplate will automatically add the reference to the SDK.

Create the project

With **AEIf Boilerplate**'s code generator, you can easily and quickly set up a contract project. See here for details.

Defining the contract

After creating the contract project, you can define the methods and types of your contract. **AEIf** defines smart contracts as services that are implemented using gRPC and Protobuf. The definition contains no logic; at build time the proto file is used to generate C# classes that will be used to implement the logic and state of the contract.

We recommend putting the contract's definition in Boilerplate's **protobuf** folder so that it can easily be included in the build/generation process and also that you name the contract with the following syntax **contract_name_contract.proto**:

```
Boilerplate
chain
protobuf
aelf
options.proto // contract options
core.proto // core blockchain types
greeter_contract.proto
another_contract.proto
token_contract.proto // system contracts
acs0.proto // AElf contract standard
...
```

The "protobuf" folder already contains a certain amount of contract definitions, including tutorial examples, system contracts. You'll also notice it contains AEIf Contract Standard definitions that are also defined the same way as contracts. Lastly, it also contains **options.proto** and **core.proto** that contain fundamental types for developing smart contracts, more on this later.

Best practices:

- place your contract definition in Boilerplate's **protobuf** folder.
- name your contract with **contractname_contract.proto**, all lower case.

Now let's take a look a the Greeter contract's definition:

```
syntax = "proto3";
import "aelf/options.proto";
import "google/protobuf/empty.proto";
import "google/protobuf/timestamp.proto";
import "google/protobuf/wrappers.proto";
option csharp_namespace = "AElf.Contracts.Greeter";
service GreeterContract {
   option (aelf.csharp_state) = "AElf.Contracts.Greeter.GreeterContractState";

   // Actions
   rpc Greet (google.protobuf.Empty) returns (google.protobuf.StringValue) { }
   rpc GreetTo (google.protobuf.StringValue) returns (GreetToOutput) { }

   // Views
   rpc GetGreetedList (google.protobuf.Empty) returns (GreetedList) {
        option (aelf.is_view) = true;
   }
}
```

```
message GreetToOutput {
    string name = 1;
    google.protobuf.Timestamp greet_time = 2;
}
message GreetedList {
    repeated string value = 1;
}
```

Above is the full definition of the contract; it is mainly composed of three parts:

- **imports**: the dependencies of your contract.
- the service definition: the methods of your contract.
- types: some custom defined types used by the contract.

Let's have a deeper look at the three different parts.

Syntax, imports and namespace

```
syntax = "proto3";
import "aelf/options.proto";
import "google/protobuf/empty.proto";
import "google/protobuf/timestamp.proto";
import "google/protobuf/wrappers.proto";
option csharp_namespace = "AElf.Contracts.Greeter";
```

The first line specifies the syntax that this protobuf file uses, we recommend you always use **proto3** for your contracts. Next, you'll notice that this contract specifies some imports, let's analyze them briefly:

- aelf/options.proto: contracts can use AElf specific options; this file contains the definitions. One example is the is_view options that we will use later.
- empty.proto, timestamp.proto and wrappers.proto: these are proto files imported directly from protobuf's library. They are useful for defining things like an empty return value, time, and wrappers around some common types such as string.

The last line specifies an option that determines the target namespace of the generated code. Here the generated code will be in the AElf.Contracts.Greeter namespace.

The service definition

```
service GreeterContract {
    option (aelf.csharp_state) = "AElf.Contracts.Greeter.GreeterContractState";

    // Actions
    rpc Greet (google.protobuf.Empty) returns (google.protobuf.StringValue) { }
    rpc GreetTo (google.protobuf.StringValue) returns (GreetToOutput) { }
```

(continues on next page)

3.1. Greeter Contract 41

```
// Views
rpc GetGreetedList (google.protobuf.Empty) returns (GreetedList) {
    option (aelf.is_view) = true;
}
```

The first line here uses the aelf.csharp_state option to specify the name (full name) of the state class. This means that the state of the contract should be defined in the GreeterContractState class under the AElf. Contracts.Greeter namespace.

Next, two action methods are defined: Greet and GreetTo. A contract method is defined by three things: the method name, the input argument(s) type(s) and the output type. For example, Greet requires that the input type is google.protobuf.Empty that is used to specify that this method takes no arguments and the output type will be a google.protobuf.StringValue is a traditional string. As you can see with the GreetTo method, you can use custom types as input and output of contract methods.

The service also defines a **view** method, that is, a method used only to query the contracts state, and that has no side effect on the state. For example, the definition of <code>GetGreetedList</code> uses the **aelf.is_view** option to make it a view method.

Best practice:

- use **google.protobuf.Empty** to specify that a method takes no arguments (import google/protobuf/empty.proto).
- use google.protobuf.StringValue to use a string (import google/protobuf/wrappers.proto).
- use the aelf.is_view option to create a view method (import aelf/options.proto).
- use the aelf.csharp_state to specify the namespace of your contracts state (import aelf/options.proto).

Custom types

```
message GreetToOutput {
    string name = 1;
    google.protobuf.Timestamp greet_time = 2;
}
message GreetedList {
    repeated string value = 1;
}
```

The protobuf file also includes the definition of two custom types. The **GreetToOutput** is the type returned by the GreetTo method and GreetedList is the return type of the GetGreetedList view method. You'll notice the **repeated** keyword the GreetedList message. This is protobuf syntax to represent a collection.

Best practice:

- use google.protobuf.Timestamp to represent a point in time (import google/protobuf/timestamp. proto).
- use **repeated** to represent a collection of items of the same type.

Extend the generated code

After defining and generating the code from the definition, the contract author extends the generated code to implement the logic of his contract. Two files are presented here:

- GreeterContract: the actual implementation of the logic, it inherits from the contract base generated by protobuf.
- **GreeterContractState**: the state class that contains properties for reading and writing the state. This class inherits the ContractState class from the C# SDK.

```
// contract/AElf.Contracts.GreeterContract/GreeterContract.cs
using Google.Protobuf.WellKnownTypes;
namespace AElf.Contracts.Greeter
   public class GreeterContract : GreeterContractContainer.GreeterContractBase
        public override StringValue Greet (Empty input)
            Context.LogDebug(() => "Hello World!");
            return new StringValue {Value = "Hello World!"};
        public override GreetToOutput GreetTo(StringValue input)
            // Should not greet to empty string or white space.
            Assert(!string.IsNullOrWhiteSpace(input.Value), "Invalid name.");
            // State.GreetedList.Value is null if not initialized.
            var greetList = State.GreetedList.Value ?? new GreetedList();
            // Add input. Value to State. GreetedList. Value if it's new to this list.
            if (!greetList.Value.Contains(input.Value))
                greetList.Value.Add(input.Value);
            // Update State. GreetedList. Value by setting it's value directly.
            State.GreetedList.Value = greetList;
            Context.LogDebug(() => "Hello {0}!", input.Value);
            return new GreetToOutput
                GreetTime = Context.CurrentBlockTime,
                Name = input.Value.Trim()
            };
        }
        public override GreetedList GetGreetedList(Empty input)
            return State.GreetedList.Value ?? new GreetedList();
    }
```

```
// contract/AElf.Contracts.GreeterContract/GreeterContractState.cs
using AElf.Sdk.CSharp.State;
namespace AElf.Contracts.Greeter
```

(continues on next page)

3.1. Greeter Contract 43

```
public class GreeterContractState : ContractState
{
    public SingletonState<GreetedList> GreetedList { get; set; }
}
```

Let's briefly explain what is happening in the GreetTo method:

Asserting

```
Assert(!string.IsNullOrWhiteSpace(input.Value), "Invalid name.");
```

When writing a smart contract, it is often useful (and recommended) to validate the input. AEIf smart contracts can use the Assert method defined in the base smart contract class to implement this pattern. For example, here, the method validates that the input string is null or composed only of white spaces. If the condition is false, this line will abort the execution of the transaction.

Accessing and saving state

```
var greetList = State.GreetedList.Value ?? new GreetedList();
...
State.GreetedList.Value = greetList;
```

From within the contract methods, you can easily access the contracts state through the State property of the contract. Here the state property refers to the GreeterContractState class in which is defined the GreetedList collection. The second effectively updates the state (this is needed; otherwise, the method would have no effect on the state).

Note that because the GreetedList type is wrapped in a SingletonState you have to use the Value property to access the data (more on this later).

Logging

```
Context.LogDebug(() => "Hello {0}!", input.Value);
```

It is also possible to log from smart contract methods. The above example will log "Hello" and the value of the input. It also prints useful information like the ID of the transaction. It will print in the console log if you launch the node with DEBUG mode. This is only for debug use and has no impacts on state at all.

More on state

As a reminder, here is the state definition in the contract (we specified the name of the class and a type) as well as the custom type GreetedList:

```
service GreeterContract {
    option (aelf.csharp_state) = "AElf.Contracts.Greeter.GreeterContractState";
    ...
}
```

```
message GreetedList {
   repeated string value = 1;
}
```

The aelf.csharp_state option allows the contract author to specify in which namespace and class name the state will be. To implement a state class, you need to inherit from the ContractState class that is contained in the C# SDK (notice the using statement here below).

Below is the state class that we saw previously:

```
using AElf.Sdk.CSharp.State;

namespace AElf.Contracts.Greeter
{
    public class GreeterContractState : ContractState
    {
        public SingletonState<GreetedList> GreetedList { get; set; }
    }
}
```

The state uses the custom GreetedList type, which was generated from the Protobuf definition at build time and contained exactly one property: a singleton state of type GreetedList.

The SingletonState is part of the C# SDK and is used to represent exactly **one** value. The value can be of any type, including collection types. Here we only wanted our contract to store one list (here a list of strings).

Note that you have to wrap your state types in a type like SingletonState (others are also available like MappedState) because behind the scene, they implement the state read and write operations.

3.1.2 Unit testing a contract

The previous article exposed how to add the proto definition and implement the logic of your contract. This article expands on the previous and will show you how to test your contract.

AEIf Contract TestKit is a testing framework specifically used to test AEIf smart contracts. With this framework, you can simulate the execution of a transaction by constructing a stub of a smart contract and using the methods provided by the Stub instance (corresponding to the contract's Action methods) and query (corresponding to the View methods of the contract), and then get the transaction execution results in the test case.

Test project

AEIf Boilerplate's code generator has automatically generated test project for you, you just need to add your test cases.

As you can see, tests are placed in the **test** folder. Each test folder usually contains a project file (.csproj) and at least four .cs files. The project file is a basic C# xUnit test project file, to which we've added some references.

```
chain
— contract
— protobuf
— src
```

(continues on next page)

3.1. Greeter Contract 45

```
Lest

AElf.Contracts.GreeterContract.Tests

AElf.Contracts.GreeterContract.Tests.csproj // xUnit test project

GreeterContractTestBase.cs

GreeterContractTestModule.cs

GreeterContractTests.cs

GreeterContractTests.cs

...
```

Test your contract

Now for the easy part, the test class only needs to inherit from the test base. After this you can go ahead and create the test cases you need.

GreeterContractTest.cs

```
public class GreeterContractTests : GreeterContractTestBase
    // declare the method as a xUnit test method
   [Fact]
   public async Task GreetTest()
        // Use the contracts stub to call the 'Greet' method and get a reference to
        // the transaction result.
       var txResult = await GetGreeterContractStub(_defaultKeyPair).Greet.
→SendAsync(new Empty());
        // check that the transaction was mined
        txResult.TransactionResult.Status.ShouldBe(TransactionResultStatus.Mined);
        // parse the result (return from the contract)
        var text = new StringValue();
        text.MergeFrom(txResult.TransactionResult.ReturnValue);
        // check that the value is correct
        text. Value. Should Be ("Hello World!");
    }
    // ...
```

From the previous code snippet you can note several things:

- the test case is a classic xUnit test class.
- you can use the contracts stub to call the contract and check returns.

Feel free to have a look at the full test class in the Boilerplate source code.

3.1.3 Run the node

Next you can run Boilerplate (and it's an internal node). This will automatically deploy the Greeter contract. Open a terminal in the root Boilerplate directory and navigate to the launcher project:

```
cd chain/src/AElf.Boilerplate.GreeterContract.Launcher
```

Next, run the node:

```
dotnet run AElf.Boilerplate.GreeterContract.Launcher.csproj
```

From here, you should see the build and eventually the nodes logs.

Boilerplate will deploy your contract when the node starts. You can call the Boilerplate node API:

```
aelf-command get-chain-status
? Enter the the URI of an AElf node: http://127.0.0.1:1235
 Succeed
  "ChainId": "AELF",
 "Branches": {
    "6032b553ec9a5c81713cf8410f426dfc1ca0f43e64d56f527fc7a9c60b90e694": 3073
 "NotLinkedBlocks": {},
 "LongestChainHeight": 3073,
 "LongestChainHash":
→ "6032b553ec9a5c81713cf8410f426dfc1ca0f43e64d56f527fc7a9c60b90e694",
 "GenesisBlockHash":
→ "c3bddca1909ebf37b95be7f26b990e07916790913e0f48da1a831b3c777d59ff",
 "GenesisContractAddress": "2gaQh4uxg6tzyH1ADLoDxvHA14FMpzEiMqsQ6sDG5iHT8cmjp8",
 "LastIrreversibleBlockHash":
→ "85fee024d156de3be665c296c567423026e0e3369ad7dc5ee81dbb2a15dfe2f2",
 "LastIrreversibleBlockHeight": 3042,
 "BestChainHash": "6032b553ec9a5c81713cf8410f426dfc1ca0f43e64d56f527fc7a9c60b90e694",
 "BestChainHeight": 3073
```

This enables further testing of the contract, including testing it from a dApp.

3.1.4 Front end

This tutorial will show you how to develop a front-end app (JavaScript in our case) that will demonstrate how to interact with a contract that was developed with Boilerplate.

At the top-level Boilerplate contains two folders:

- chain: used for developing the contracts.
- web: used for developing the front-end.

The **web** folder already contains some projects that can serve as examples. This tutorial presents a front-end for the Greeter contract shown in the previous tutorials.

Run the front-end

After you run Boilerplate, open another terminal at the repo's root and navigate to the greeter project:

```
cd web/greeter
```

From here, you can install and run the Greeter's front end:

3.1. Greeter Contract 47

```
npm i npm start
```

And a page will be opened by webpack in your default browser.

Front-end code

The code is straightforward, it uses aelf-sdk + webpack. You can check out more here.

Warning: be careful, this code is in no way production-ready and is for demonstration purposes only.

It demonstrates the following capabilities of the js sdk:

- getting the chain status.
- getting a contract object.
- calling a contract method.
- calling a view method.

Getting the chain status

The following code snippet shows how to call the nodes API to get the chains status:

```
aelf.chain.getChainStatus()
   .then(res => {
        if (!res) {
            throw new Error('Error occurred when getting chain status');
        }
        // use the chain status
    })
    .catch(err => {
        console.log(err);
    });
```

For more information about the chain status API: GET/api/blockChain/chainStatus.

As we will see next, the chain status is very useful for retrieving the genesis contract.

getting a contract object

The following code snippet shows how to get a contract object with the js-sdk:

```
async function getContract(name, walletInstance) {

   // if not loaded, load the genesis
   if (!genesisContract) {
      const chainStatus = await aelf.chain.getChainStatus();
      if (!chainStatus) {
            throw new Error('Error occurred when getting chain status');
      }
      genesisContract = await aelf.chain.contractAt(chainStatus.

GenesisContractAddress, walletInstance);
}
```

```
// if the contract is not already loaded, get it by name.
   if (!contract[name]) {
       const address = await genesisContract.GetContractAddressByName.
\rightarrow call (sha256 (name));
       contract = {
            ...contract,
            [name]: await aelf.chain.contractAt(address, walletInstance)
       } ;
   return contract[name];
```

As seen above, the following steps will enable you to build a contract object:

- use **getChainStatus** to get the genesis contract's address.
- use **contractAt** to build an instance of the genesis contract.
- use the genesis contract to get the address of the greeter contract with the GetContractAddressByName method.
- with the address use **contractAt** again to build a greeter contract object.

Once you have a reference to the greeter contract, you can use it to call the methods.

calling a contract method

The following snippet shows how to send a transaction to the contract:

```
greetToButton.onclick = () => {
    getContract('AElf.ContractNames.Greeter', wallet)
        .then(greeterContract => greeterContract.GreetTo({
            value: "SomeName"
        }))
        .then(tx => pollMining(tx.TransactionId))
        .then(ret => {
            greetToResponse.innerHTML = ret.ReadableReturnValue;
        })
        .catch(err => {
            console.log(err);
        });
};
```

Here the **getContract** retrieves the greeter contract instance. On the instance it calls **GreetTo** that will send a transaction to the node. The **pollMining** method is a helper method that will wait for the transaction to be mined. After mined the transaction results, ReadableReturnValue will be used to see the result.

calling a view method

The following snippet shows how to call a view method on the contract:

```
getGreeted.onclick = () => {
   getContract('AElf.ContractNames.Greeter', wallet)
```

3.1. Greeter Contract 49

```
.then(greeterContract => greeterContract.GetGreetedList.call())
.then(ret => {
        greeted.innerHTML = JSON.stringify(ret, null, 2);
})
.catch(err => {
        console.log(err);
});
};
```

Here the **getContract** retrieves the greeter contract instance. On the instance, it calls **GetGreetedList** with ".call" appended to it, which will indicate a read-only execution (no broadcasted transaction).

3.2 Smart contract deployment

After the contract has been compiled, the user must register this contract with the blockchain. Generally, to deploy a contract, there must be transactions sent to Smart contract zero, which is one of AElf's genesis contracts. The node will then broadcast these transactions, and it will eventually get included in a block when the block gets executed the smart contract will be deployed.

For contract deployment, what matters is the ContractDeploymentAuthorityRequired option in the ContractOptions for this network. It is determined since the launch of the chain.

- if ContractDeploymentAuthorityRequired is false, anyone can directly deploy contract with transaction
- Only account with specific authority is permitted to deploy contract if ContractDeploymentAuthorityRequired is true

This part will introduce contract deployment pipeline for different chain type on AElf mainnet/testnet/customnet network.

3.2.1 Authority check

ContractDeploymentAuthorityRequired is false

Anyone can directly deploy contract with transaction if ContractDeploymentAuthorityRequired is false. It is usually set as false especially when it is for contract unit test or custom network.

```
rpc DeploySmartContract (ContractDeploymentInput) returns (aelf.Address) {
}

message ContractDeploymentInput {
    sint32 category = 1;
    bytes code = 2;
}
```

The return value of this transaction indicates the address of the deployed contract. Note that you should specific 0 as category for c# contract and provide your contract dll bytes.

ContractDeploymentAuthorityRequired is true

ContractDeploymentAuthorityRequired is always true when it comes to public networks(Mainnet/Testnet). And contract pipelines are distinguished for different chain types. But for sure, no

one can directly deploy.

For public network, no matter it is mainnet or testnet, things are going more complex. No one can directly deploy on the chain but few authorities have the permission to propose.

- Main Chain: only current miners have the permission to propose contract
- Exclusive Side Chain: only side chain creator are allowed to propose contract
- Shared Side Chain: anyone can propose contract

And contract proposing steps are provided as below

```
rpc ProposeNewContract (ContractDeploymentInput) returns (aelf.Hash) {
}
message ContractDeploymentInput {
    sint32 category = 1;
    bytes code = 2;
}

message ContractProposed
{
    option (aelf.is_event) = true;
    aelf.Hash proposed_contract_input_hash = 1;
}
```

Event ContractProposed will be fired containing proposed_contract_input_hash and this will also trigger the first proposal for one parliament organization, which is specified as contract deployment controller since the beginning of the chain. This proposal would be expired in 24 hours. Once the proposal can be released (refer to *Parliament contract* for detail), proposer should send transaction to

This will trigger the second proposal for one parliament organization, which is specified as contract code-check controller since the beginning of the chain. This proposal would be expired in 10 min. Once the proposal can be released, proposer should send transaction to

```
rpc ReleaseCodeCheckedContract (ReleaseContractInput) returns (google.protobuf.

Description of the proposal independent of the proposal independent input in
```

Finally, the contract would be deployed. Event ContractDeployed containing new contract address will be fired and it is available in TransactionResult.Logs.

3.2.2 Use aelf-command send or aelf-command proposal to deploy

If you set ContractDeploymentAuthorityRequired: true in appsetting.json, please use aelf-command proposal.

- You must input contract method parameters in the prompting way, note that you can input a relative or absolute path of contract file to pass a file to aelf-command, aelf-command will read the file content and encode it as a base64 string.
- After call ProposeNewContract, you need to wait for the organization members to approve your proposal and you can release your proposal by calling ReleaseApprovedContract and ReleaseCodeCheckedContract in this order.

The deploy command(This command has been deprecated)

The **deploy** command on the cli will help you deploy the contract:

```
aelf-command deploy <category> <code>
```

The deploy command will create and send the transaction to the nodes RPC. Here the **code** is the path to the compiled code. This will be embedded in the transaction as a parameter to the **DeploySmartContract** method on smart contract zero. The command will return the ID of the transaction that was sent by the command. You will see in the next section how to use it.

verify the result

When the deployment transaction gets included in a block, the contract should be deployed. To check this, you can use the transaction ID returned by the deploy command. When the status of the transaction becomes **mined**: "Status": "Mined", then the contract is ready to be called.

The **ReadableReturnValue** field indicates the address of the deployed contract. You can use this address to call the contract methods.

CHAPTER 4

AEIf Blockchain Boot Sequence

This section mainly explains how the AElf Blockchain starts from the initial nodes, and gradually replaces the initial nodes with true production nodes through elections, thus completing the complete process of AElf Blockchain startup.

4.1 Start initial nodes

We need to start at least one or more initial nodes to start the AEIf Blockchain, and 1-5 initial nodes are recommended.

In the Getting Started section, we described the steps to start multiple nodes, you can follow the *Running multi-nodes* with *Docker* to complete the initial nodes startup (this section also takes the example of starting three initial nodes).

Since the default period of election time is 604800 seconds(7 days), if you want to see the result of the election more quickly, modify the configuration file appsettings.json before starting the boot nodes to set the PeriodSeconds to smaller:

```
"Consensus": {
    "PeriodSeconds": 604800
},
}
```

4.2 Run full node

4.2.1 Create an account for the full node:

```
aelf-command create

AElf [Info]: Your wallet info is:
AElf [Info]: Mnemonic : major clap hurdle hammer push slogan ranch quantum.

→reunion hope enroll repeat
```

4.2.2 Start full node:

The startup steps for the full node are similar to the initial node startup, but the configuration file section notes that the InitialMinerList needs to be consistent with the initial node:

4.2.3 Full node started successfully:

By checking the current node state, it can be seen that the full node is synchronizing, and the BestChainHeight and the LastIrreversibleBlockHeight are growing up. After catching up with the height of the initial node, the subsequent steps can be carried out.

```
aelf-command get-chain-status
 "ChainId": "AELF",
  "Branches": {
   "fb749177c2f43db8c7d73ea050240b9f870c40584f044b13e7ec146c460b0eff": 2449
 "NotLinkedBlocks": {},
 "LongestChainHeight": 2449,
 "LongestChainHash":
→"fb749177c2f43db8c7d73ea050240b9f870c40584f044b13e7ec146c460b0eff",
 "GenesisBlockHash":
→"ea9c0b026bd638ceb38323eb71174814c95333e39c62936a38c4e01a8f18062e",
 "GenesisContractAddress": "pykr77ft9UUKJZLVq15wCH8PinBSjVRQ12sD1Ayq92mKFsJ1i",
 "LastIrreversibleBlockHash":
→ "66638f538038bd56357f3cf205424e7393c5966830ef0d16a75d4a117847e0bc",
 "LastIrreversibleBlockHeight": 2446,
 "BestChainHash": "fb749177c2f43db8c7d73ea050240b9f870c40584f044b13e7ec146c460b0eff",
  "BestChainHeight": 2449
```

4.3 Be a candidate node

Full nodes need to call Election contract to become candidate nodes. The nodes need to mortgage 10W ELF to participate in the election, please make sure that the account of the nodes has enough tokens.

To facilitate the quick demonstration, we directly transfer the token from the first initial node account to the full node account:

```
aelf-command send AElf.ContractNames.Token Transfer '{"symbol": "ELF", "to":

→"Q3t34SAEsxAQrSQidTRzDonWNTPpSTgH8bqu8pQUGCSWRPdRC", "amount": "2000000000000"}'
```

By checking the balance of the full node account, we can see that the full node account has enough tokens, 20W ELF:

```
aelf-command call AElf.ContractNames.Token GetBalance '{"symbol": "ELF", "owner":

→"Q3t34SAEsxAQrSQidTRzDonWNTPpSTgH8bqu8pQUGCSWRPdRC"}'

Result:
{
    "symbol": "ELF",
    "owner": "Q3t34SAEsxAQrSQidTRzDonWNTPpSTgH8bqu8pQUGCSWRPdRC",
    "balance": "20000000000000"
}
```

Full node announces election with admin specified in params:

```
aelf-command send AElf.ContractNames.Election AnnounceElection '{"value":

→"Q3t34SAEsxAQrSQidTRzDonWNTPpSTgH8bqu8pQUGCSWRPdRC"}' -a_

→Q3t34SAEsxAQrSQidTRzDonWNTPpSTgH8bqu8pQUGCSWRPdRC
```

By inquiring candidate information, we can see the full node is already candidates:

4.4 User vote election

For the simulated user voting scenario, we create a user account:

```
aelf-command create (continues on next page)
```

```
AElf [Info]: Your wallet info is:

AElf [Info]: Mnemonic : walnut market museum play grunt chuckle hybrid

accuse relief misery share meadow

AElf [Info]: Private Key :

919a220fac2d80e674a256f2367ac840845f344269f4dcdd56d37460de17f947

AElf [Info]: Public Key :

904794948de40ffda2a6c884d7e6a99bb8e42b8b96b9ee5cc4545da3ald5f7725eec93de62ddbfb598ef6f04fe52aa310accate

AElf [Info]: Address : ZBBPU7DMVQ72YBQNmaKTDPKaAkHNzzA3naH5B6kE7cBm8g1ei
```

After the user account is created successfully, we will first trsnfer some tokens to the account for voting.

```
aelf-command send AElf.ContractNames.Token Transfer '{"symbol": "ELF", "to":

→"ZBBPU7DMVQ72YBQNmaKTDPKaAkHNzzA3naH5B6kE7cBm8g1ei", "amount": "200000000000"}'
```

Confirm the tokens has been received:

Users vote on candidate nodes through the election contract.

```
aelf-command send AElf.ContractNames.Election Vote '{"candidatePubkey":

→"04eed00eb009ccd283798e3862781cebd25ed6a4641e0e1b7d0e3b6b59025040679fc4dc0edc9de166bd630c7255188a96

→", "amount":2000000000, "endTimestamp":{"seconds":1600271999, "nanos":999000}}' -a_

→ZBBPU7DMVQ72YBQNmaKTDPKaAkHNzzA3naH5B6kE7cBm8g1ei
```

By inquiring the votes of candidates, we can see that the full node has successfully obtained 20 votes.

4.5 Become production node

At the next election, the candidate nodes with votes in the first 17 are automatically elected as production nodes, and the current production node list can be viewed through consensus contracts.

Quantity 17 is the default maximum production node quantity, which can be modified by proposal. Please refer to the Consensus and Proposal Contract API for details.

4.6 Add more production nodes

Repeat steps 2-4 to add more production nodes. When the number of initial nodes plus the number of candidate nodes exceeds the maximum number of production node, the replacement will replace the initial nodes step by step, and the replaced initial nodes are not allowed to run for election again. At this time, the initial node has completed its responsibility of starting AElf Blockchain.

How to join the testnet

There's two ways to run a AEIf node: you can either use Docker (recommended method) or run the binaries available on Github. Before you jump into the guides and tutorials you'll need to install the following tools and frameworks. For most of these dependencies we provide ready-to-use command line instructions. In case of problems or if you have more complex needs, we provide more information in the *Environment setup* section.

Summary of the steps to set up a node:

- 1. Execute the snapshot download script and load the snapshot into the database.
- 2. Download our template setting files and docker run script.
- 3. Modify the appsettings according to your needs.
- 4. Run and check the node.

Hardware suggestion: for the AEIf testnet we use the following Amazon configuration: c5.large instance with 2 vCPUs, 4GiB RAM and a 200GiB hard drive for each node we run. We recommend using something similar per node that you want to run (one for the mainchain node and one per side chain node).

Note: any server you use to run a node should be time synced via NTP. Failing to do this will prevent your node from syncing.

5.1 Setup the database

We currently support two key-value databases to store our nodes data: Redis and SSDB, but for the testnet we only provide snapshots for SSDB. We will configure two SSDB instances, one for chain database and one for the state database (run these on different machines for better performances).

5.1.1 Import the snapshot data

After you've finished setting up the database, download the latest snapshots. The following gives you the template for the download URL, but you have to specify the snapshot date. We recommend you get the latest.

Restore the chain database from snapshot:

```
>> mkdir snapshot
>> cd snapshot
## fetch the snapshot download script
>> curl -O -s https://aelf-node.s3-ap-southeast-1.amazonaws.com/snapshot/testnet/
→download-mainchain-db.sh
## execute the script, you can optionally specify a date by appending "yyyymmdd" as.
→parameter
>> sh download-mainchain-db.sh
## chain database: decompress and load the chain database snapshot
>> tar xvzf aelf-testnet-mainchain-chaindb-*.tar.gz
>> stop your chain database instance (ssdb server)
>> cp -r aelf-testnet-mainchain-chaindb-*/* /path/to/install/chaindb/ssdb/var/
>> start your chain database instance
>> enter ssdb console (ssdb-cli) use the "info" command to confirm that the data has_
→been imported)
## state database : decompress and load the state database
>> tar xvzf aelf-testnet-mainchain-statedb-*.tar.gz
>> stop your state database instance (ssdb server)
>> cp -r aelf-testnet-mainchain-statedb-*/* /path/to/install/statedb/ssdb/var/
>> start your state database instance
>> enter ssdb console (ssdb-cli) use the "info" command to confirm that the data has_
→been imported)
```

5.2 Node configuration

5.2.1 Generating the nodes account

This section explains how to generate an account for the node. First you need to install the aelf-command npm package. Open a terminal and enter the following command to install aelf-command:

```
>> npm i -g aelf-command
```

After installing the package, you can use the following command to create an account/key-pair:

```
>> aelf-command create
```

The command prompts for a password, enter it and don't forget it. The output of the command should look something like this:

```
AElf [Info]: Your wallet info is:
AElf [Info]: Mnemonic : term jar tourist monitor melody tourist catch sad_
ankle disagree great adult
AElf [Info]: Private Key :_
34192c729751bd6ac0a5f18926d74255112464b471aec499064d5d1e5b8ff3ce
AElf [Info]: Public Key :_
404904e51a944ab13b031cb4fead8caa6c027b09661dc5550ee258ef5c5e78d949b1082636dc8e27f20bc427b25b99a1cada
AElf [Info]: Address : 29KM437eJRRuTfvhsB8QAsyVvi8mmyN9Wqqame6TsJhrqXbeWd
? Save account info into a file? Yes
? Enter a password: *********
```

```
? Confirm password: *******

✓ Account info has been saved to "/usr/local/share/aelf/keys/

→29KM437eJRRuTfvhsB8QAsyVvi8mmyN9Wqqame6TsJhrqXbeWd.json"
```

In the next steps of the tutorial you will need the Public Key and the Address for the account you just created. You'll notice the last line of the commands output will show you the path to the newly created key. The aelf directory is the data directory (datadir) and this is where the node will read the keys from.

Note that a more detailed section about the cli can be found command line interface.

5.2.2 Prepare node configuration

Update the appsetting.json file with your account. This will require the information printed during the creation of the account. Open the appsettings.json file and edit the following sections.

The account/key-pair associated with the node we are going to run:

```
"Account": {
    "NodeAccount": "2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR5oGin1sys6H",
    "NodeAccountPassword": "*******"
}
}
```

You also have to configure the database connection strings (port/db number):

```
"ConnectionStrings": {
    "BlockchainDb": "redis://your chain database server ip address:port",
    "StateDb": "redis://your state database server ip address:port"
    },
}
```

If you use docker to run the node and it is on the same server as the database, please do not use 127.0.0.1 as the database monitoring ip.

Next add the testnet mainchain nodes as peer (bootnode peers):

Note: if your infrastructure is behind a firewall you need to open the P2P listening port of the node. You also need

to configure your listening ip and port for the side chain connections in appsettings.MainChain.TestNet.json:

```
"CrossChain": {
    "Grpc": {
        "LocalServerPort": 5000,
        }
},
```

5.3 Running a full node with Docker

To run the node with Docker, enter the following commands:

```
## pull AElf's image and navigate to the template folder to execute the start script
>> docker pull aelf/node:testnet-v1.0.0
>> cd /opt/aelf-node
>> sh aelf-node.sh start aelf/node:testnet-v1.0.0
```

to stop the node you can run:

```
>> sh aelf-node.sh stop
```

5.4 Running a full node with the binary release

Most of AEIf is developed with dotnet core, so to run the binaries you will need to download and install the .NET Core SDK before you start: Download .NET Core 6.0. For now AEIf depends on version 6.0 of the SDK, on the provided link find the download for your platform, and install it.

Get the latest release with the following commands:

Enter the configuration folder and run the node:

```
>> cd /opt/aelf-node
>> dotnet aelf/AElf.Launcher.dll
```

5.5 Running a full node with the source

The most convenient way is to directly use docker or the binary packages, but if you want you can compile from source code. First make sure the code version is consistent (current is release AELF v1.0.0), and secondly make sure to compile on a Ubuntu Linux machine (we recommend Ubuntu 18.04.2 LTS) and have dotnet core SDK version 6.0 installed. This is because different platforms or compilers will cause the dll hashes to be inconsistent with the current chain.

5.6 Check the node

You now should have a node that's running, to check this run the following command that will query the node for its current block height:

```
aelf-command get-blk-height -e http://your node ip address:port
```

5.7 Run side-chains

This section explains how to set up a side-chain node, you will have to repeat these steps for all side chains (currently only one is running):

- 1. Fetch the appsettings and the docker run script.
- 2. Download and restore the snapshot data with the URLs provided below (steps are the same as in A Setup the database).
- 3. Run the side-chain node.

Running a side chain is very much like running a mainchain node, only configuration will change. Here you can find the instructions for sidechain1:

```
>> cd /tmp/ && wget https://github.com/AElfProject/AElf/releases/download/v1.0.0-rc1/

aelf-testnet-sidechain1.zip

>> unzip aelf-testnet-sidechain1.zip

>> mv aelf-testnet-sidechain1 /opt/aelf-node
```

In order for a sidechain to connect to a mainchain node you need to modify the appsettings. SideChain. TestNet.json with your node information.

Here you can find the snapshot data for the only current side-chain running, optionally you can specify the date, but we recommend you get the latest:

```
>> curl -O -s https://aelf-node.s3-ap-southeast-1.amazonaws.com/snapshot/testnet/

-download-sidechain1-db.sh
```

Here you can find the list of templates folders (appsettings and docker run script) for the side-chain:

```
wget https://github.com/AElfProject/AElf/releases/download/v1.0.0-rc1/aelf-testnet-

→sidechain1.zip
```

Each side chain has its own P2P network, add the testnet sidechain nodes as peer:

```
bootnode → ["xxx.xxxx.xxx:6800", "..."]
```

5.6. Check the node

How to join the mainnet

There's two ways to run a AEIf node: you can either use Docker (recommended method) or run the binaries available on Github. Before you jump into the guides and tutorials you'll need to install the following tools and frameworks. For most of these dependencies we provide ready-to-use command line instructions. In case of problems or if you have more complex needs, we provide more information in the *Environment setup* section.

Summary of the steps to set up a node:

- 1. Execute the snapshot download script and load the snapshot into the database.
- 2. Download our template setting files and docker run script.
- 3. Modify the appsettings according to your needs.
- 4. Run and check the node.

Hardware suggestion: for the AEIf mainnet we use the following Amazon configuration: c5.xlarge instance with 4 vCPUs, 8GiB RAM and a 500GiB hard drive for each node we run. We recommend using something similar per node that you want to run (one for the mainchain node and one per side chain node).

Note: any server you use to run a node should be time synced via NTP. Failing to do this will prevent your node from syncing.

6.1 Setup the database

We currently support two key-value databases to store our nodes data: Redis and SSDB, but for the mainnet we only provide snapshots for SSDB. We will configure two SSDB instances, one for chain database and one for the state database (run these on different machines for better performances).

6.1.1 Import the snapshot data

After you've finished setting up the database, download the latest snapshots. The following gives you the template for the download URL, but you have to specify the snapshot date. We recommend you get the latest.

Restore the chain database from snapshot:

```
>> mkdir snapshot
>> cd snapshot
## fetch the snapshot download script
>> curl -O -s https://aelf-backup.s3.ap-northeast-2.amazonaws.com/snapshot/mainnet/
→download-mainchain-db.sh
## execute the script, you can optionally specify a date by appending "yyyymmdd" as.
→parameter
>> sh download-mainchain-db.sh
## chain database: decompress and load the chain database snapshot
>> tar xvzf aelf-mainnet-mainchain-chaindb-*.tar.gz
>> stop your chain database instance (ssdb server)
>> cp -r aelf-mainnet-mainchain-chaindb-*/* /path/to/install/chaindb/ssdb/var/
>> start your chain database instance
>> enter ssdb console (ssdb-cli) use the "info" command to confirm that the data has_
→been imported)
## state database : decompress and load the state database
>> tar xvzf aelf-mainnet-mainchain-statedb-*.tar.gz
>> stop your state database instance (ssdb server)
>> cp -r aelf-mainnet-mainchain-statedb-*/* /path/to/install/statedb/ssdb/var/
>> start your state database instance
>> enter ssdb console (ssdb-cli) use the "info" command to confirm that the data has_
→been imported)
```

6.2 Node configuration

6.2.1 Generating the nodes account

This section explains how to generate an account for the node. First you need to install the aelf-command npm package. Open a terminal and enter the following command to install aelf-command:

```
>> npm i -g aelf-command
```

After installing the package, you can use the following command to create an account/key-pair:

```
>> aelf-command create
```

The command prompts for a password, enter it and don't forget it. The output of the command should look something like this:

```
AElf [Info]: Your wallet info is:
AElf [Info]: Mnemonic : term jar tourist monitor melody tourist catch sad,
ankle disagree great adult
AElf [Info]: Private Key :
34192c729751bd6ac0a5f18926d74255112464b471aec499064d5d1e5b8ff3ce
AElf [Info]: Public Key :
404904e51a944ab13b031cb4fead8caa6c027b09661dc5550ee258ef5c5e78d949b1082636dc8e27f20bc427b25b99a1cada
AElf [Info]: Address : 29KM437eJRRuTfvhsB8QAsyVvi8mmyN9Wqqame6TsJhrqXbeWd
Save account info into a file? Yes
Enter a password: *********
```

```
? Confirm password: *******

✓ Account info has been saved to "/usr/local/share/aelf/keys/

→29KM437eJRRuTfvhsB8QAsyVvi8mmyN9Wqqame6TsJhrqXbeWd.json"
```

In the next steps of the tutorial you will need the Public Key and the Address for the account you just created. You'll notice the last line of the commands output will show you the path to the newly created key. The aelf directory is the data directory (datadir) and this is where the node will read the keys from.

Note that a more detailed section about the cli can be found command line interface.

6.2.2 Prepare node configuration

Update the appsetting.json file with your account. This will require the information printed during the creation of the account. Open the appsettings.json file and edit the following sections.

The account/key-pair associated with the node we are going to run:

```
"Account": {
    "NodeAccount": "2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR5oGin1sys6H",
    "NodeAccountPassword": "*******"
}
}
```

You also have to configure the database connection strings (port/db number):

```
"ConnectionStrings": {
    "BlockchainDb": "redis://your chain database server ip address:port",
    "StateDb": "redis://your state database server ip address:port"
    },
}
```

If you use docker to run the node and it is on the same server as the database, please do not use 127.0.0.1 as the database monitoring ip.

Next add the mainnet mainchain nodes as peer (bootnode peers):

Note: if your infrastructure is behind a firewall you need to open the P2P listening port of the node. You also need

to configure your listening ip and port for the side chain connections in appsettings.MainChain.MainNet.json:

```
"CrossChain": {
    "Grpc": {
        "LocalServerPort": 5000,
        }
},
```

6.3 Running a full node with Docker

To run the node with Docker, enter the following commands:

```
## pull AElf's image and navigate to the template folder to execute the start script
>> docker pull aelf/node:mainnet-v1.0.0
>> cd /opt/aelf-node
>> sh aelf-node.sh start aelf/node:mainnet-v1.0.0
```

to stop the node you can run:

```
>> sh aelf-node.sh stop
```

6.4 Running a full node with the binary release

Most of AEIf is developed with dotnet core, so to run the binaries you will need to download and install the .NET Core SDK before you start: Download .NET Core 6.0. For now AEIf depends on version 6.0 of the SDK, on the provided link find the download for your platform, and install it.

Get the latest release with the following commands:

```
>> cd /tmp/ && wget https://github.com/AElfProject/AElf/releases/download/v1.0.0/aelf.

-> zip
>> unzip aelf.zip
>> mv aelf /opt/aelf-node/
```

Enter the configuration folder and run the node:

```
>> cd /opt/aelf-node
>> dotnet aelf/AElf.Launcher.dll
```

6.5 Running a full node with the source

The most convenient way is to directly use docker or the binary packages, but if you want you can compile from source code. First make sure the code version is consistent (current is release AELF v1.0.0), and secondly make sure to compile on a Ubuntu Linux machine (we recommend Ubuntu 18.04.2 LTS) and have dotnet core SDK version 6.0 installed. This is because different platforms or compilers will cause the dll hashes to be inconsistent with the current chain.

6.6 Check the node

You now should have a node that's running, to check this run the following command that will query the node for its current block height:

```
aelf-command get-blk-height -e http://your node ip address:port
```

6.7 Run side-chains

This section explains how to set up a side-chain node, you will have to repeat these steps for all side chains (currently only one is running):

- 1. Fetch the appsettings and the docker run script.
- 2. Download and restore the snapshot data with the URLs provided below (steps are the same as in Setup the database).
- 3. Run the side-chain node.

Running a side chain is very much like running a mainchain node, only configuration will change. Here you can find the instructions for sidechain1:

```
>> cd /tmp/ && wget https://github.com/AElfProject/AElf/releases/download/v1.0.0/aelf-

--mainnet-sidechain1.zip

>> unzip aelf-mainnet-sidechain1.zip

>> mv aelf-mainnet-sidechain1 /opt/aelf-node
```

In order for a sidechain to connect to a mainchain node you need to modify the appsettings. SideChain. MainNet.json with your node information.

```
"CrossChain": {
    "Grpc": {
        "ParentChainServerPort": 5001,
        "ParentChainServerIp": "your mainchain ip address",
        "ListeningPort": 5011,
    },
    "ParentChainId": "AELF",
    "Economic": {
        "SymbolListToPayTxFee": "WRITE, READ, STORAGE, TRAFFIC",
        "SymbolListToPayRental": "CPU, RAM, DISK, NET"
    }
}
```

Here you can find the snapshot data for the only current side-chain running, optionally you can specify the date, but we recommend you get the latest:

```
>> curl -0 -s https://aelf-backup.s3.ap-northeast-2.amazonaws.com/snapshot/mainnet/

-download-sidechain-db.sh
```

Here you can find the list of templates folders (appsettings and docker run script) for the side-chain:

```
wget https://github.com/AElfProject/AElf/releases/download/v1.0.0/aelf-mainnet-

sidechain1.zip
```

6.6. Check the node

Each side chain has its own P2P network, add the mainnet sidechain nodes as peer:

```
bootnode → ["xxx.xxxx.xxx:6800", "..."]
```

Running a side chain

7.1 Requesting the creation of a side chain

Side chains can be created in the AELF ecosystem to enable scalability. This part is going to introduce these periods in detail.

7.1.1 Side chain creation api

Anyone can request the side chain creation in the AELF ecosystem. The proposer/creator of a new side chain will need to request the creation of the side chain through the cross-chain contract on the main-chain. The request contains different fields that will determine the type of side chain that will be created.

This section show the API to use in order to propose the creation of a side chain. The fields that are in the SideChainCreationRequest will determine the type of side chain that is created. For more api details, you can follow the RequestSideChainCreation in *Crosschain contract*.

A new proposal about the side chain creation would be created and the event ProposalCreated containing proposal id would be fired. A parliament organization which is specified since the chain launched is going to approve this proposal in 24 hours(refer to *Parliament contract* for detail). Proposer is able to release the side chain creation request with proposal id once the proposal can be released. Refer ReleaseSideChainCreation in *Crosschain contract*.

New side chain would be created and the event SideChainCreatedEvent containing chain id would be fired.

Side chain node can be launched since it is already created on main chain. Side chain id from the creation result should be configured correctly before launching the side chain node. Please make sure cross chain communication context is correctly set, because side chain node is going to request main chain node for chain initialization data. For more details, check *side chain node running* tutorial.

7.1.2 Side chain types

Two types of side-chain's currently exist: **exclusive** or **shared**. An **exclusive** side-chain is a type of dedicated side-chain (as opposed to shared) that allows developers to choose the transaction fee model and set the transaction fee

price. The creator has exclusive use of this side-chain. For example, only creator of this **exclusive** side-chain can propose to deploy a new contract.

7.1.3 Pay for Side chain

Indexing fee

Indexing fee, literally, is paid for the side chain indexing. You can specify the indexing fee price and prepayments amount when you request side chain creation. *Cross chain contract* is going to charge your prepayments once the side chain created and pay the miner who indexes the side chain block every time.

Resource fee

Developers of an exclusive side-chain pay the producers for running it by paying CPU, RAM, DISK, NET resource tokens: this model is called *charge-by-time*. The amount side chain creator must share with the producers is set after creation of the chain. The **exclusive** side-chain is priced according to the time used. The unit price of the fee is determined through negotiation between the production node and the developer.

See Economic whitepaper - 4.3 Sidechain Developer Charging Model for more information.

7.1.4 Simple demo for side chain creation request

When a user (usually a developer) feels the need to create a new side chain on AEIf he must call the cross-chain contract and request a side chain creation. After requested, parliament organization members will either approve this creation or reject it. If the request is approved, the developer must then release the proposal.

Throughout this tutorial we'll give step-by-step code snippets that use the aelf-js-sdk to create a new side chain, the full script will be given at the end of the tutorial.

This creation of a side chain (logical, on-chain creation) is done in four steps:

- the developer must allow/approve some tokens to the cross-chain contract of the main chain.
- the developer calls the cross-chain contract of the main chain, to request the creation.
- the parliament organization members must *approve* this request.
- finally the developer must *release* the request to finalize the creation.

Keep in mind that this is just the logical on-chain creation of the side chain. After the side chain is released there's extra steps needed for it to be a fully functional blockchain, including the producers running the side chain's nodes.

Set-up

If you want to test the creation process you will need a producer node running and the following:

- you need a key-pair (account) created, this will be your Producer (in this tutorial we also use the producer to create the creation request).
- the node needs to be configured with an API endpoint, account and miner list that correspond to what is in the script.

The following snippet shows constants and initialization code used in the script:

```
const AElf = require('aelf-sdk');
const Wallet = AElf.wallet;
const { sha256 } = AElf.utils;
// set the private key of the block producer.
// REPLACE
const defaultPrivateKey =
→'e119487fea0658badc42f089fbaa56de23d8c0e8d999c5f76ac12ad8ae897d76';
const defaultPrivateKeyAddress = 'HEtBQStfqu53cHVC3PxJU6iGP3RGxiNUfQGvAPTjfrF3ZWH3U';
// load the wallet associated with your block producers account.
const wallet = Wallet.getWalletByPrivateKey(defaultPrivateKey);
// API link to the node
// REPLACE
const aelf = new AElf(new AElf.providers.HttpProvider('http://127.0.0.1:1234'));
// names of the contracts that will be used.
const tokenContractName = 'AElf.ContractNames.Token';
const parliamentContractName = 'AElf.ContractNames.Parliament';
const crossChainContractName = 'AElf.ContractNames.CrossChain';
const createSideChain = async () => {
    // check the chain status to make sure the node is running
    const chainStatus = await aelf.chain.getChainStatus({sync: true});
    const genesisContract = await aelf.chain.contractAt(chainStatus.
→GenesisContractAddress, wallet)
        .catch((err) => {
        console.log(err);
   // get the addresses of the contracts that we'll need to call
   \verb|const| to kenContractAddress| = \verb|await| genesisContract.GetContractAddressByName.
→call(sha256(tokenContractName));
    \verb|const| parliamentContractAddress| = \textbf{await} | \texttt{genesisContract.GetContractAddressByName.}|
→call(sha256(parliamentContractName));
    \verb|const| crossChainContractAddress| = \textbf{await} | \texttt{genesisContract}. \texttt{GetContractAddressByName}.
// build the aelf-sdk contract instance objects
    const parliamentContract = await aelf.chain.contractAt(parliamentContractAddress,_
→wallet);
   const tokenContract = await aelf.chain.contractAt(tokenContractAddress, wallet);
   const crossChainContract = await aelf.chain.contractAt(crossChainContractAddress,...
→wallet);
```

When running the script, the **createSideChain** will be executed and automatically will run through the full process of creating the side chain.

Creation of the side chain

Set the Allowance.

First the developer must approve some ELF tokens for use by the cross-chain contract.

```
var setAllowance = async function(tokenContract, crossChainContractAddress)
{
    // set some allowance to the cross-chain contract
    const approvalResult = await tokenContract.Approve({
        symbol:'ELF',
        spender: crossChainContractAddress,
        amount: 20000
      });
    let approveTransactionResult = await pollMining(approvalResult.TransactionId);
}
```

Creation request

In order to request a side chain creation the developer must call **RequestSideChainCreation** on the cross-chain contract, this will create a proposal with the **Parliament** contract. After calling this method, a **ProposalCreated** log will be created in which the **ProposalId** be found. This ID will enable the producers to approve it.

```
rpc RequestSideChainCreation(SideChainCreationRequest) returns (google.protobuf.Empty)
\hookrightarrow \{ \}
message SideChainCreationRequest {
    // The cross chain indexing price.
   int64 indexing_price = 1;
    // Initial locked balance for a new side chain.
   int64 locked_token_amount = 2;
    // Creator privilege boolean flag: True if chain creator privilege preserved,
→otherwise false.
   bool is_privilege_preserved = 3;
    // Side chain token information.
   SideChainTokenCreationRequest side_chain_token_creation_request = 4;
    // A list of accounts {\tt and} amounts that will be issued when the chain starts.
    repeated SideChainTokenInitialIssue side_chain_token_initial_issue_list = 5;
    // The initial rent resources.
    map<string, int32> initial_resource_amount = 6;
message SideChainTokenCreationRequest{
   // Token symbol of the side chain to be created
    string side_chain_token_symbol = 1;
    // Token name of the side chain to be created
   string side_chain_token_name = 2;
    // Token total supply of the side chain to be created
   int64 side_chain_token_total_supply = 3;
    // Token decimals of the side chain to be created
    int32 side_chain_token_decimals = 4;
message SideChainTokenInitialIssue{
    // The account that will be issued.
    aelf.Address address = 1;
```

```
// The amount that will be issued.
int64 amount = 2;
}
```

In order for the creation request to succeed, some assertions must pass:

- the Sender can only have one pending request at any time.
- the locked_token_amount cannot be lower than the indexing price.
- if **is_privilege_preserved** is true, which means it requests **exclusive** side chain, the token initial issue list cannot be empty and all with an **amount** greater than 0.
- if **is_privilege_preserved** is true, which means it requests **exclusive** side chain, the **initial_resource_amount** must contain all resource tokens of the chain and the value must be greater than 0.
- the allowance approved to cross chain contract from the proposer (Sender of the transaction) cannot be lower than the **locked_token_amount**.
- no need to provide data about side chain token if **is_privilege_preserved** is false, and side chain token won't be created even you provide token info.

```
const sideChainCreationRequestTx = await crossChainContract.RequestSideChainCreation(
\hookrightarrow {
    indexingPrice: 1,
   lockedTokenAmount: '20000',
    isPrivilegePreserved: true,
    sideChainTokenCreationRequest: {
        sideChainTokenDecimals: 8,
        sideChainTokenName: 'SCATokenName',
        sideChainTokenSymbol: 'SCA',
        sideChainTokenTotalSupply: '1000000000000000',
    },
    sideChainTokenInitialIssueList: [
        {
            address: '28Y8JA1i2cN6oHvdv7EraXJr9a1qY6D1PpJXw9QtRMRwKcBQMK',
            amount: '100000000000000'
    ],
    initialResourceAmount: { CPU: 2, RAM: 4, DISK: 512, NET: 1024 },
});
let sideChainCreationRequestTxResult = await pollMining(sideChainCreationRequestTx.
→TransactionId);
// deserialize the log to get the proposal's ID.
let deserializedLogs = parliamentContract.
→deserializeLog(sideChainCreationRequestTxResult.Logs, 'ProposalCreated');
```

The last line will print the proposal ID and this is what will be used for approving by the producers.

Approval from producers

This is where the parliament organization members approve the proposal:

Note: when calling **Approve** it will be the *Sender* of the transaction that approves. Here the script is set to use the key of one parliament organization member, see full script at the end.

Release

This part of the script releases the proposal:

```
var releaseResult = await crossChainContract.ReleaseSideChainCreation({
    proposalId: deserializedLogs[0].proposalId
});

let releaseTxResult = await pollMining(releaseResult.TransactionId);

// Parse the logs to get the chain id.
let sideChainCreationEvent = crossChainContract.deserializeLog(releaseTxResult.Logs,
    'SideChainCreatedEvent');
```

This is the last step involved in creating a side chain, after this the chain id of the new side chain is accessible in the **SideChainCreatedEvent** event log.

Full script

This section presents the full script. Remember that in order to run successfully, a node must be running, configured with one producer. The configured producer must match the **defaultPrivateKey** and **defaultPrivateKeyAddress** of the script.

Also, notice that this script by default tries to connect to the node's API at the following address http://127.0.0.1:1234, if your node is listening on a different address you have to modify the address.

If you haven't already installed it, you need the aelf-sdk:

```
npm install aelf-sdk
```

You can simply run the script from anywhere:

```
node sideChainProposal.js
```

sideChainProposal.js:

```
// link to the node
const aelf = new AElf(new AElf.providers.HttpProvider('http://127.0.0.1:8000'));
if (!aelf.isConnected()) {
   console.log('Could not connect to the node.');
const tokenContractName = 'AElf.ContractNames.Token';
const parliamentContractName = 'AElf.ContractNames.Parliament';
const crossChainContractName = 'AElf.ContractNames.CrossChain';
var pollMining = async function(transactionId) {
   console.log(`>> Waiting for ${transactionId} the transaction to be mined.`);
   for (i = 0; i < 10; i++) {
        const currentResult = await aelf.chain.getTxResult(transactionId);
        // console.log('transaction status: ' + currentResult.Status);
        if (currentResult.Status === 'MINED')
            return currentResult;
        await new Promise(resolve => setTimeout(resolve, 2000))
            .catch(function () {
                console.log("Promise Rejected");
            });;
    }
var setAllowance = async function(tokenContract, crossChainContractAddress)
   console.log('\n>>>> Setting allowance for the cross-chain contract.');
    // set some allowance to the cross-chain contract
   const approvalResult = await tokenContract.Approve({
        symbol:'ELF',
        spender: crossChainContractAddress,
        amount: 20000
   });
   await pollMining(approvalResult.TransactionId);
}
var checkAllowance = async function(tokenContract, owner, spender)
   console.log('\n>>>> Checking the cross-chain contract\'s allowance');
   const checkAllowanceTx = await tokenContract.GetAllowance.call({
       symbol: 'ELF',
       owner: owner,
       spender: spender
   });
   console.log(`>> allowance to the cross-chain contract: ${checkAllowanceTx.
→allowance} ${checkAllowanceTx.symbol}`);
const createSideChain = async () => {
```

```
// get the status of the chain in order to get the genesis contract address
   console.log('Starting side chain creation script\n');
   const chainStatus = await aelf.chain.getChainStatus({sync: true});
   const genesisContract = await aelf.chain.contractAt(chainStatus.
→GenesisContractAddress, wallet)
       .catch((err) => {
           console.log(err);
       });

   var releaseResult = await crossChainContract.ReleaseSideChainCreation({
        proposalId: deserializedLogs[0].proposalId
    });
   let releaseTxResult = await pollMining(releaseResult.TransactionId);
   // Parse the logs to get the chain id.
   let sideChainCreationEvent = crossChainContract.deserializeLog(releaseTxResult.
→Logs, 'SideChainCreatedEvent');
   console.log('Chain chain created : ');
   console.log(sideChainCreationEvent);
};
createSideChain().then(() => {console.log('Done.')});
```

7.2 Running a side chain (after its release)

This tutorial will explain how to run a side chain node after it has been *approved* by the producers and *released* by the creator. After the creation of the side chain, the producers need to run a side chain node.

A side chain node is usually very similar to a main-chain node because both are based on AElf software and have common modules. The main difference is the configuration which varies depending on if the node is a side chain or not.

Note: this tutorial assumes the following:

- you already have a main-chain node running.
- the creation of the side chain has already been approved and released.

It's also **important** to know that the key-pair (account) used for mining on the side chain must be the **same** as the one you use for on the main-chain node. Said in another way both production nodes need to be launched with the **same** key-pair.

Note: for more information about the side chain creation, refer to the document in the request-side-chain section.

7.2.1 Side chain configuration

Two configuration files must be placed in the configuration folder of the side chain, this is also the folder from which you will launch the node:

- · appsettings.json
- appsettings.SideChain.MainNet.json

After the *release* of the side chain creation request, the **ChainId** of the new side chain will be accessible in the **SideChainCreatedEvent** logged by the transaction that released.

In this example, we will set up the side chain node with **tDVV** (1866392 converted to base58) as it's chain id, connecting to Redis' **db2**. The web API port is **1235**. Don't forget to change the **account**, **password** and **initial miner**.

If at the time of launching the side chain the P2P addresses of the other peers is known, they should be added to the bootnodes in the configuration of the side chain.

In **appsettings.json** change the following configuration sections:

```
"ChainId": "tDVV",
"ChainType": "SideChain",
"NetType": "MainNet",
"ConnectionStrings": {
  "BlockchainDb": "redis://localhost:6379?db=2",
  "StateDb": "redis://localhost:6379?db=2"
},
"Account": {
  "NodeAccount": "YOUR PRODUCER ACCOUNT",
  "NodeAccountPassword": "YOUR PRODUCER PASSWORD"
},
"Kestrel": {
  "EndPoints": {
      "Http": {
          "Url": "http://*:1235/"
  }
},
"Consensus": {
  "MiningInterval": 4000,
  "StartTimestamp": 0
},
```

In appsettings.SideChain.MainNet.json change the following configuration sections:

```
"CrossChain": {
    "Grpc": {
        "ParentChainServerPort": 5010,
        "ListeningPort": 5000,
        "ParentChainServerIp": "127.0.0.1"
      },
      "ParentChainId": "AELF",
    }
}
```

Change ParentChainServerIp and ParentChainServerPort depending on the listening address of your mainchain node.

7.2.2 Launch the side chain node

Open a terminal and navigate to the folder where you created the configuration for the side chain.

dotnet ../AElf.Launcher.dll

You can try out a few commands from another terminal to check if everything is fine, for example:

aelf-command get-blk-height -e http://127.0.0.1:1235

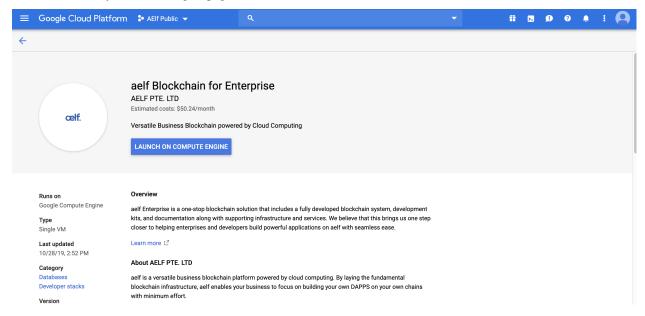

Running AEIf on the cloud

This section provides resources for AElf on the cloud.

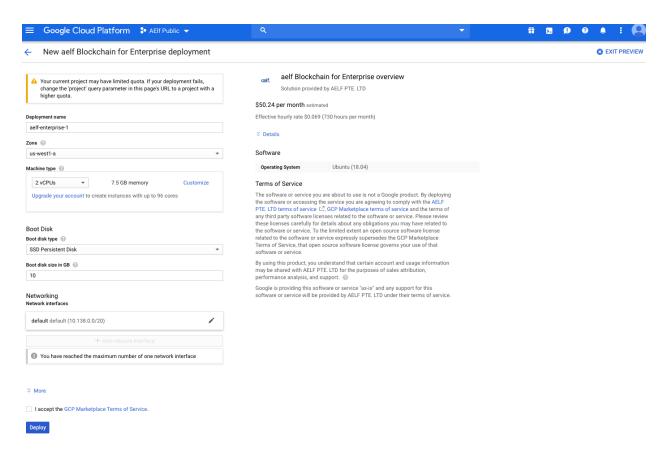

8.1 Getting started with Google cloud

This guide will run you through the steps required to run an AElf node on Google cloud (click the images for a more detailed view).

First go to the Google Cloud Market Place and search for "aelf blockchain for enterprise", find the image and select it, this will direct you to the image's page.

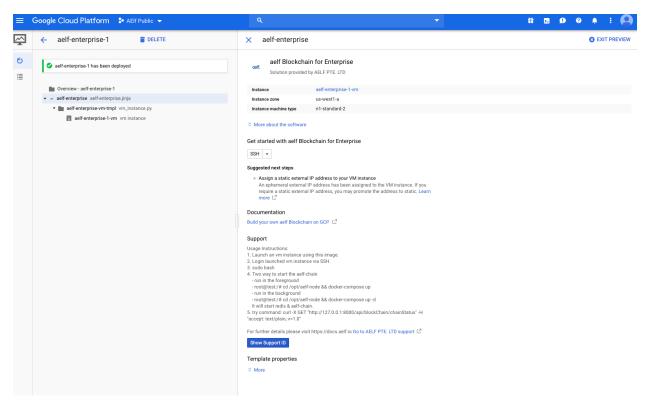

Click on the "LAUNCH ON COMPUTE ENGINE". This should bring you to the following deployment page:

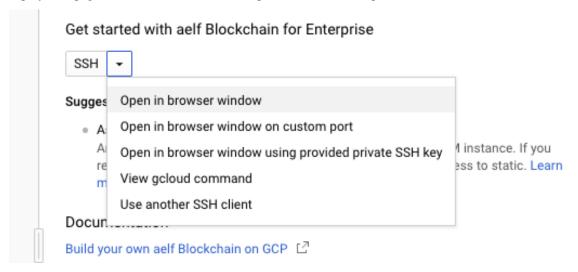

You can keep the default settings, they are sufficient to get started. If you're satisfied with the settings, just click "DEPLOY" (bottom left of the page).

This will bring you to the deployment page (wait a short moment for the instance to load), when finished you should see deployment information about the instance:

Next, login to the launched VM instance via SSH. To start the easiest way is to login to the instance directly from this deployment page. To do this click the SSH drop down and select "Open in browser window":

After loading the session, you'll get a shell to the deployed instance where you can run the chain itself.

First you'll need to execute sudo bash to elevate your privileges. Next, start the chain with one of the following commands (for this tutorial we'll use the second method): - either run it in the foreground: -bash root@test:/#cd/opt/aelf-node && docker-compose up

• or run it in the background: -bash root@test:/# cd /opt/aelf-node && docker-compose up -d

These commands will start redis and an AEIf node (the command prints 'done' when finished).

```
ubuntu@test:/opt/aelf-node$ sudo docker-compose up -d
sudo: unable to resolve host test
Creating aelf-node_redis_1_1c73bb0fe27b ... done
Creating aelf-node_aelf-node_1_b673d69e0560 ... done
```

Finally to verify that the node is correctly working, enter the following command that will send an http request to the node in order to get the current status of the chain:

ubuntu@test:/opt/aelf-node\$ curl -X GET "http://127.0.0.1:8001/api/blockChain/chainStatus" -H "accept: text/plain; v=1.0"
{"ChainId":"AELF","Branches":{"3f41068dea72676a4de567b0098ae1bf5708d63e0d32e2745210b366a6dc0265":6727},"NotLinkedBlocks":{},"Lo
ngestChainHeight":6727,"LongestChainHash":"3f41068dea72676a4de567b0098ae1bf5708d63e0d32e2745210b366a6dc0265","GenesisBlockHash"
:"32472fa4f6a04f31f6d1c6303e7d69c496da016900559d4873a0e4c731c9f9bf","GenesisContractAddress":"2gaQh4uxg6tzyH1ADLoDxvHA14FMpzEiM
qsQ6sDG5iHT8cmjp8","LastIrreversibleBlockHash":"f89761efcf8f9f8f8c369ead32fd97ff9115bc2db5cbfaa600e7bcbc2cefa2ba","LastIrrevers
ibleBlockHeight":6703,"BestChainHash":"3f41068dea72676a4de567b0098ae1bf5708d63e0d32e2745210b366a6dc0265","BestChainHeight":6727

If everything is working normally you should be able to see the chain increase by repeating the last command.

Smart Contract Developing Demos

9.1 Bingo Game

9.1.1 Requirement Analysis

Basic Requirement

Only one ruleUsers can bet a certain amount of ELF on Bingo contract, and then users will gain more ELF or to lose all ELF bet before in the expected time.

For users, operation steps are as follows:

- 1. Send an Approve transaction by Token Contract to grant Bingo Contract amount of ELF.
- 2. Bet by Bingo Contract, and the outcome will be unveiled in the expected time.
- 3. After a certain time, or after the block height is reached, the user can use the Bingo contract to query the results, and at the same time, the Bingo contract will transfer a certain amount of ELF to the user (If the amount at this time is greater than the bet amount, it means that the user won; vice versa).

9.1.2 **API List**

In summary, two basic APIs are needed:

- 1. Play, corresponding to step 2;
- 2. Bingo, corresponding to step 3.

In order to make the Bingo contract a more complete DApp contract, two additional Action methods are added:

- 1. Register, which creates a file for users, can save the registration time and user's eigenvalues (these eigenvalues participate in the calculation of the random number used in the Bingo game);
- 2. Quit, which deletes users' file.

In addition, there are some View methods for querying information only:

- 1. GetAward, which allows users to query the award information of a bet;
- 2. GetPlayerInformation, used to query player's information.

Method	Parameters	Return	function
Register	Empty	Empty	register player infor-
			mation
Quit	Empty	Empty	delete player informa-
			tion
Play	Int64Value	Int64Value	debt
	anount you debt	the resulting	
		block height	
Bingo	Hash	Empty	query the game's re-
	the transaction	True indicates	sult
	id of Play	win	
GetAward	Hash	Int64Value	query the amount of
	the transaction	award	award
	id of Play		
GetPlayerInformati	○Address	Player-	query player's infor-
	player's address	Information	mation

9.1.3 Write Contract

Use the code generator to generate contracts and test projects

Open the AElf.Boilerplate.CodeGenerator project in the *AElf.Boilerplate*https://aelf-boilerplate-docs.readthedocs.io/en/latest/usage/setup.html#try-code-generator, and modify the Contents node in appsetting.json under this project:

```
{
   "Contents": [
   {
      "Origin": "AElf.Contracts.HelloWorldContract",
      "New": "AElf.Contracts.BingoContract"
},
   {
      "Origin": "HelloWorld",
      "New": "Bingo"
},
   {
      "Origin": "hello_world",
      "New": "bingo"
}
],
```

Then run the AElf.Boilerplate.CodeGenerator project. After running successfully, you will see a *AElf.Contracts.BingoContract.sln* in the same directory as the *AElf.Boilerplate.sln* is in. After opening the sln, you will see that the contract project and test case project of the Bingo contract have been generated and are included in the new solution.

Define Proto

Based on the API list in the requirements analysis, the bingo_contract.proto file is as follows:

```
syntax = "proto3";
import "aelf/core.proto";
import "aelf/options.proto";
import "google/protobuf/empty.proto";
import "google/protobuf/wrappers.proto";
import "google/protobuf/timestamp.proto";
option csharp_namespace = "AElf.Contracts.BingoContract";
service BingoContract {
   option (aelf.csharp_state) = "AElf.Contracts.BingoContract.BingoContractState";
   // Actions
    rpc Register (google.protobuf.Empty) returns (google.protobuf.Empty) {
    rpc Play (google.protobuf.Int64Value) returns (google.protobuf.Int64Value) {
    rpc Bingo (aelf.Hash) returns (google.protobuf.BoolValue) {
    rpc Quit (google.protobuf.Empty) returns (google.protobuf.Empty) {
   // Views
   rpc GetAward (aelf.Hash) returns (google.protobuf.Int64Value) {
        option (aelf.is_view) = true;
   rpc GetPlayerInformation (aelf.Address) returns (PlayerInformation) {
        option (aelf.is_view) = true;
message PlayerInformation {
   aelf.Hash seed = 1;
   repeated BoutInformation bouts = 2;
   google.protobuf.Timestamp register_time = 3;
message BoutInformation {
   int64 play_block_height = 1;
   int64 amount = 2;
   int64 award = 3;
   bool is_complete = 4;
   aelf.Hash play_id = 5;
    int64 bingo_block_height = 6;
```

Contract Implementation

Here only talk about the general idea of the Action method, specifically need to turn the code:

https://github.com/AElfProject/aelf-boilerplate/blob/dev/chain/contract/AElf.Contracts.BingoGameContract/BingoGameContract.cs

Register & Quit

Register

• Determine the Seed of the user, Seed is a hash value, participating in the calculation of the random number, each user is different, so as to ensure that different users get different results on the same height;

9.1. Bingo Game 89

• Record the user's registration time.

QuitJust delete the user's information.

Play & Bingo

Play

- Use TransferFrom to deduct the user's bet amount:
- At the same time add a round (Bount) for the user, when the Bount is initialized, record three messages 1.PlayId, the transaction Id of this transaction, is used to uniquely identify the Bout (see BoutInformation for its data structure in the Proto definition);
- AmountRecord the amount of the bet 3.Record the height of the block in which the Play transaction is packaged.

Bingo

- Find the corresponding Bout according to PlayId, if the current block height is greater than PlayBlock-Height + number of nodes * 8, you can get the result that you win or lose;
- Use the current height and the user's Seed to calculate a random number, and then treat the hash value as a bit Array, each of which is added to get a number ranging from 0 to 256.
- Whether the number is divisible by 2 determines the user wins or loses;
- The range of this number determines the amount of win/loss for the user, see the note of GetKind method
 for details.

9.1.4 Write Test

Because the token transfer is involved in this test, in addition to constructing the stub of the bingo contract, the stub of the token contract is also required, so the code referenced in csproj for the proto file is:

Then you can write test code directly in the Test method of BingoContractTest. Prepare the two stubs mentioned above:

The stub is the stub of the bingo contract, and the tokenStub is the stub of the token contract.

In the unit test, the keyPair account is given a large amount of ELF by default, and the bingo contract needs a certain bonus pool to run, so first let the account transfer ELF to the bingo contract:

```
// Prepare awards.
await tokenStub.Transfer.SendAsync(new TransferInput
{
    To = DAppContractAddress,
        Symbol = "ELF",
        Amount = 100_00000000
});
```

Then you can start using the Bingo contract. Register

```
await stub.Register.SendAsync(new Empty());
```

After registration, take a look at PlayInformation:

```
// Now I have player information.
var address = Address.FromPublicKey(keyPair.PublicKey);
{
   var playerInformation = await stub.GetPlayerInformation.CallAsync(address);
   playerInformation.Seed.Value.ShouldNotBeEmpty();
   playerInformation.RegisterTime.ShouldNotBeNull();
}
```

Bet, but before you can bet, you need to Approve the bingo contract:

```
// Play.
await tokenStub.Approve.SendAsync(new ApproveInput
{
    Spender = DAppContractAddress,
    Symbol = "ELF",
    Amount = 10000
});
await stub.Play.SendAsync(new Int64Value {Value = 10000});
```

See if Bout is generated after betting.

```
Hash playId;
{
    var playerInformation = await stub.GetPlayerInformation.CallAsync(address);
    playerInformation.Bouts.ShouldNotBeEmpty();
    playId = playerInformation.Bouts.First().PlayId;
}
```

Since the outcome requires eight blocks, you need send seven invalid transactions (these transactions will fail, but the block height will increase):

```
// Mine 7 more blocks.
for (var i = 0; i < 7; i++)
{
    await stub.Bingo.SendWithExceptionAsync(playId);
}</pre>
```

Last check the award, and that the award amount is greater than 0 indicates you win.

```
await stub.Bingo.SendAsync(playId);
var award = await stub.GetAward.CallAsync(playId);
award.Value.ShouldNotBe(0);
```

9.1. Bingo Game 91

Consensus

10.1 Overview

The process of reaching consensus is an essential part of every blockchain, since its what determines which transactions get included in the block and in what order. A stable and efficient Block formation mechanism is the foundation of the AElf system. The operation and maintenance of AElf is more complicated than Bitcoin and Ethereum, because AElf Block formation requires the Main Chain to record information from Side Chains, and AElf is designed to provide cloud-based enterprise services in a more complex structure. In addition, miners need to update information from multiple parallel Chains. The Main Chain will adopt AEDPoS consensus to ensure high frequency and predictability of Block formation, which will improve user experience.

In an AElf blockchain, consensus protocol is split into two parts: election and scheduling. Election is the process that determines **who** gets to produce and scheduling decides on the **when**.

10.1.1 Core Data Center

Core Data Centers aka Miners or Block Producers, act as members of parliament in the world of AEIf blockchain. The AEIf blockchain delegates 2N+1 Core Data Centers. N starts with 8 and increases by 1 every year.

N starts at 8 and increases by 1 each year

These nodes in the AEIf system enforce all of consensus rules of AEIf. The purpose of these delegated mining nodes is to enable transaction relay, transaction confirmation, packaging blocks and data transfer. As AEIf adopts multi-Side

Chain architecture, Core Data Centers have to work as miners for some Side Chains. 2N+1 nodes will go through a randomized order calculation each week.

All the Core Data Centers are elected by the ELF token hodlers. Electors can lock their ELF tokens to vote to one Validate Data Center, thus enhance the competitiveness of certain Validate Data Center in the election process.

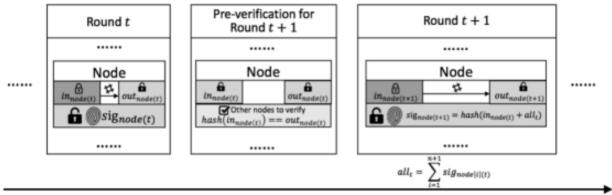

10.1.2 Validate Data Center

In the AEIf blockchain, everyone can lock an amount of ELF tokens to announce himself joining the election. Among all the nodes who announced joining election, top (2N+1)*5 nodes will become Validate Data Center. N starts with 8 and increases by 1 every year.

10.2 AEDPoS Process

10.2.1 Round

The AEIf blockchain is running along the timeline within processing units we call a "round".

Rounds running in the timeline

In a round, one node (Core Data Center) will produce one block each time, while one node will have one extra transaction at the end of the round.

Each mining node has three main properties in a specific round t:

- Private key, **in_node(t)**, which is a value inputted from the mining node and kept privately by the mining node itself in round **t**. It will become public after all block generations in round **t** are completed;
- Public key, **out_node(t)**, which is the hash value of **in_node(t)**. Every node in the aelf network can look up this value at any time;
- Signature, **sig_node(t)**, which is a value generated by the mining node itself in the first round. After the first round, it can only be calculated once the previous round is completed. It is used as the signature of this mining node in this round and it is also opened to public at all times like the **out_node(t)**.

10.2.2 Main Processes

Pre-Verification

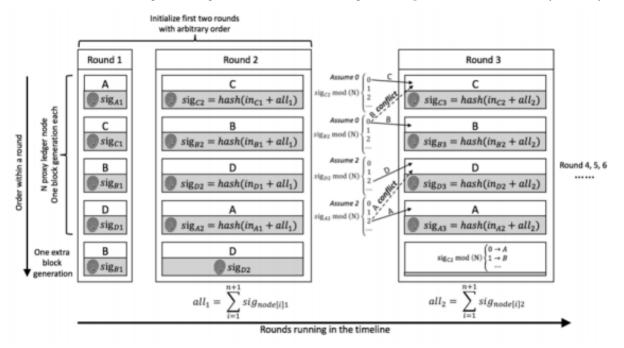

Before a node starts its block generation in round (t+1), it has to have its status verified in round t. In round (t+1), in node(t) is already published as public, and **out node(t)** can be queried at any time. So to verify the status of in

round, other nodes can check hash(in node(t)) = out node(t).

Order Calculation

In each round N, Core Data Centers have (N+1) block generation time slots, each time slot have 1 to 8 blocks generation based on current running status in the AElf blockchain.

In the first round, the ordering of block generations as well as the signature (sig) for each node are totally arbitrary.

In the second round, the block generations are again arbitrarily ordered. However, from the second round, the sig-

$$all_t = \sum_{i=1}^{n+1} sig_{node[i](t)}$$

nature will be calculated by $sig_node(t+1) = hash(in_node(t) + all_t)$ where node[i][t], means the node is processing the i-th transaction in round t.

From round 3, the ordering within a round is generated from the ordering and the node signature from the previous round.

In round (t+1), we traverse the signature of nodes at round t in order. The ordering of a node in (t+1) is calculated by

$$sig_{node(t)} mod(N) = \begin{cases} 0, & first \ place \\ 1, & second \ place \\ 2, & third \ place \\ \cdots \\ n-1, & n^{th} \ place \end{cases}$$

For cases of conflict, i.e. results pointed to places which are not empty, we point the node to the next available place. If the node conflict is at the **n-th** place, we will find the available place from the first place.

10.2. AEDPoS Process 95

The node that processes the one extra transaction is calculated from the signature of the node in first place of the previous round.

$$sig_{node[0](t)}mod(N) = \begin{cases} 0, & A \\ 1, & B \\ 2, & C \\ \dots \end{cases}$$

sig_node[0][t] is decided by:

- all the signatures from previous round (t-1);
- the **in** value of itself in round (**t-1**);
- which node generate the extra block.

So it can only be calculated after the previous round (**t-1**) completed. Moreover, as it needs all the signatures from the previous round and the **in** value is input by each node independently, there is no way to control the ordering. The extra block generation is used to increase the randomness. In general, we create a random system that relies on extra inputs from outside. Based on the assumption that no node can know all other nodes' inputs in a specific round, no one node could control the ordering.

If one node cannot generate a block in round \mathbf{t} , it also cannot input \mathbf{in} its for this round. In such a case, the previous \mathbf{in} will be used. Since all mining nodes are voted to be reliable nodes, such a situation should not happen often. Even if this situation does happen, the above-mentioned strategy is more than sufficient at dealing with it.

Every node only has a certain time T seconds to process transactions. Under the present network condition, T=4 is a reasonable time consideration, meaning that every node only has 4 seconds to process transactions and submit the result to the network. Any delegate who fails to submit within 4 seconds is considered to be abandoning the block. If a delegate failed two times consecutively, there will be a window period calculated as W hours (W=2^N, N stands for the number of failure) for that node.

In the systematic design, aelf defines that only one node generates blocks within a certain period. Therefore, it is unlikely for a fork to happen in an environment where mining nodes are working under good connectivity. If multiple orphan node groups occur due to network problems, the system will adopt the longest chain since that is 19 the chain that most likely comes from the orphan node group with largest number of mining nodes. If a vicious node mines in two forked Blockchains simultaneously to attack the network, that node would be voted out of the entire network.

AEDPoS mining nodes are elected in a way that resembles representative democracy. The elected nodes decide how to hand out bonuses to the other mining nodes and stakeholders.

10.3 Irreversible Block

Which means there're always some block links (a block height to its hash value) can never be reversible.

The block link currently is double confirmed by the AEDPoS mechanism during the Round changes.

CHAPTER 11

Network

11.1 Introduction

The role that the network layer plays in AElf is very important, it maintains active and healthy connections to other peers of the network and is of course the medium through which nodes communicate and follow the chain protocol. The network layer also implements interfaces for higher-level logic like the synchronization code and also exposes some functionality for the node operator to administer and monitor network operations.

The design goals when designing AElf's network layer was to avoid "reinventing the wheel" and keep things as simply possible, we ended up choosing gRPC to implement the connections in AElf. Also, it was important to isolate the actual implementation (the framework used) from the contract (the interfaces exposed to the higher-level layers) to make it possible to switch implementation in the future without breaking anything.

11.2 Architecture

This section will present a summary of the different layers that are involved in network interactions.

The network is split into 3 different layers/projects, namely:

- AElf.OS
 - Defines event handles related to the network.
 - Defines background workers related to the network.
- AElf.OS.Core.Network
 - Defines service layer exposed to higher levels.
 - Contains the definitions of the infrastructure layer.
 - Defines the component, types.
- AElf.OS.Network.Grpc
 - The implementation of the infrastructure layer.

- Launches events defined in the core
- Low-level functionality: serialization, buffering, retrying...

11.2.1 **AEIf.OS**

At the AElf.OS layer, the network monitors events of interest to the network through event handlers, such as kernel layer transaction verification, block packaging, block execution success, and discovery of new libs. The handler will call NetworkService to broadcast this information to its connected peer. And it will run background workers to process network tasks regularly.

Currently, the AElf.OS layer handles those events related to the network:

- Transaction Accepted Eventthe event that the transaction pool receives the transaction and passes verification
- Block Mined Eventwhen the current node is BP, the event that the block packaging is completed.
- Block Accepted Eventthe event that the node successfully executes the block.
- New Irreversible Block Found Eventthe event that the chain found the new irreversible block.

Currently, the AEIf.OS layer will periodically process the following tasks.

- Peer health check: regularly check whether the connected peer is healthy and remove the abnormally connected peer.
- Peer retry connection: peer with abnormal connection will try to reconnect.
- Network node discovery: regularly discover more available nodes through the network.

11.2.2 AEIf.OS.Core.Network

AEIf.OS.Core.Network is the core module of the networkcontains services(service layer exposed to higher levels (OS)) and definitions (abstraction of the Infrastructure layer).

- Application layer implementation:
 - NetworkService: this service exposes and implements functionality that is used by higher layers like the sync and RPC modules. It takes care of the following:
 - * sending/receiving: it implements the functionality to request a block(s) or broadcast items to peers by using an IPeerPool to select peers. This pool contains references to all the peers that are currently connected.
 - * handling network exceptions: the lower-level library that implements the Network layer is expected to throw a NetworkException when something went wrong during a request.
- Infrastructure layer implementation and definition:
 - IPeerPool/PeerPool: manages active connections to peers.
 - IPeer: an active connection to a peer. The interface defines the obvious request/response methods, it exposes a method for the NetworkService to try and wait for recovery after some network failure. It contains a method for getting metrics associated with the peer. You can also access information about the peer itself (ready for requesting, IP, etc.).
 - IAEIfNetworkServer: manages the lifecycle of the network layer, implements listening for connections, it is the component that accepts connections. For now, it is expected that this component launches NetworkInitializationFinishedEvent when the connection to the boot nodes is finished.
- Definitions of types (network_types.proto and partial).

• Defines the event that should be launched from the infrastructure layer's implementation.

11.2.3 AEIf.OS.Network.Grpc

The AEIf.OS.Network.Grpc layer is the network infrastructure layer that we implement using the gRPC framework.

- GrpcPeerimplemented the interface IPeer defined by the AEIf.OS.Core.Network layer
- GrpcNetworkServer: implemented the interface IAElfNetworkServer defined by the AElf.OS.Core.Network layer
- GrpcServerService: implemented network service interfaces, including interfaces between nodes and data exchange.
- Extra functionality:
 - Serializing requests/deserializing responses (protobuf).
 - Some form of request/response mechanism for peers (optionally with the timeout, retry, etc).
 - Authentification.

In fact, gRPC is not the only option. Someone could if they wanted to replace the gRPC stack with a low-level socket API (like the one provided by the dotnet framework) and re-implement the needed functionality. As long as the contract (the interface) is respected, any suitable framework can be used if needed.

11.3 Protocol

Each node implements the network interface protocol defined by AEIf to ensure normal operation and data synchronization between nodes.

11.3.1 Connection

DoHandshake

When a node wants to connect with the current node, the current node receives the handshake information of the target node through the interface DoHandshake. After the current node verifies the handshake information, it returns the verification result and the handshake information of the current node to the target node.

The handshake information, in addition to being used in the verification of the connection process, will also record the status of the other party's chain after the connection is successful, such as the current height, Lib height, etc.

```
rpc DoHandshake (HandshakeRequest) returns (HandshakeReply) {}
```

Handshake Message

```
message Handshake {
    HandshakeData handshake_data = 1;
    bytes signature = 2;
    bytes session_id = 3;
}
```

- handshake data: the data of handshake.
- signature: the signatrue of handshake data.
- session_id: randomly generated ids when nodes connect.

11.3. Protocol 99

HandshakeData Message

```
message HandshakeData {
   int32 chain_id = 1;
   int32 version = 2;
   int32 listening_port = 3;
   bytes pubkey = 4;
   aelf.Hash best_chain_hash = 5;
   int64 best_chain_height = 6;
   aelf.Hash last_irreversible_block_hash = 7;
   int64 last_irreversible_block_height = 8;
   google.protobuf.Timestamp time = 9;
}
```

- chain id: the id of current chain.
- version: current version of the network.
- listening_port: the port number at which the current node network is listening.
- pubkey: the public key of the current node used by the receiver to verify the data signature.
- best_chain_hash: the lastest block hash of the best branch.
- best_chain_height: the lastest block height of the best branch.
- last_irreversible_block_hash: the hash of the last irreversible block.
- last_irreversible_block_height: the height of the last irreversible block.
- time: the time of handshake.
- · HandshakeRequest Message

```
message HandshakeRequest {
    Handshake handshake = 1;
}
```

- handshake: complete handshake information, including handshake data and signature.
- · HandshakeReply Message

```
message HandshakeReply {
    Handshake handshake = 1;
    HandshakeError error = 2;
}
```

- handshake: complete handshake information, including handshake data and signature.
- error: handshake error enum.
- · HandshakeError Enum

```
enum HandshakeError {
    HANDSHAKE_OK = 0;
    CHAIN_MISMATCH = 1;
    PROTOCOL_MISMATCH = 2;
    WRONG_SIGNATURE = 3;
    REPEATED_CONNECTION = 4;
    CONNECTION_REFUSED = 5;
    INVALID_CONNECTION = 6;
    SIGNATURE_TIMEOUT = 7;
}
```

- HANDSHAKE_OK: indicate no error actually; the default value.
- CHAIN_MISMATCH: the chain ID does not match.
- PROTOCOL_MISMATCH: the network version does not match.
- WRONG_SIGNATURE: the signature cannot be verified.
- REPEATED_CONNECTION: multiple connection requests were sent by the same peer.
- CONNECTION_REFUSED: peer actively rejects the connection, either because the other party's connection pool is slow or because you have been added to the other party's blacklist.
- INVALID_CONNECTION: connection error, possibly due to network instability, causing the request to fail during the connection.
- SIGNATURE_TIMEOUT: the signature data has timed out.

3.1.2 ConfirmHandshake

When the target node verifies that it has passed the current node's handshake message, it sends the handshake confirmation message again.

```
rpc ConfirmHandshake (ConfirmHandshakeRequest) returns (VoidReply) {}

message ConfirmHandshakeRequest {
}
```

11.3.2 Broadcasting

BlockBroadcastStream

The interface BlockCastStream is used to receive information about the block and its complete transaction after the BP node has packaged the block.

```
rpc BlockBroadcastStream (stream BlockWithTransactions) returns (VoidReply) {}
```

```
message BlockWithTransactions {
   aelf.BlockHeader header = 1;
   repeated aelf.Transaction transactions = 2;
}
```

- header:
- · transactions:

TransactionBroadcastStream

TransactionBroadcastStream used to receive other nodes forward transaction information.

```
rpc TransactionBroadcastStream (stream aelf.Transaction) returns (VoidReply) {}
```

11.3. Protocol 101

AnnouncementBroadcastStream

Interface AnnouncementBroadcastStream used to receive other nodes perform block after block information broadcast.

```
rpc AnnouncementBroadcastStream (stream BlockAnnouncement) returns (VoidReply) {}
```

```
message BlockAnnouncement {
   aelf.Hash block_hash = 1;
   int64 block_height = 2;
}
```

- block_hash: the announced block hash.
- block_height: the announced block height.

LibAnnouncementBroadcastStream

Interface LibAnnouncementBroadcastStream used to receive other nodes Lib changed Lib latest information broadcast.

```
rpc LibAnnouncementBroadcastStream (stream LibAnnouncement) returns (VoidReply) {}
```

```
message LibAnnouncement {
    aelf.Hash lib_hash = 1;
    int64 lib_height = 2;
}
```

- lib_hash: the announced last irreversible block hash.
- lib_height: the announced last irreversible block height.

11.3.3 Block Request

RequestBlock

The interface RequestBlock requests a single block in response to other nodes. Normally, the node receives block information packaged and broadcast by BP. However, if the block is not received for some other reason. The node may also receive BlockAnnouncement messages that are broadcast after the block has been executed by other nodes, so that the complete block information can be obtained by calling the RequestBlock interface of other peers.

```
rpc RequestBlock (BlockRequest) returns (BlockReply) {}
```

• BlockRequest Message

```
message BlockRequest {
   aelf.Hash hash = 1;
}
```

- hash: the block hash that you want to request.
- · BlockReply Message

```
message BlockReply {
    string error = 1;
    BlockWithTransactions block = 2;
}
```

- error: error message.
- block: the requested block, including complete block and transactions information.

RequestBlocks

The interface RequestBlock requests blocks in bulk in response to other nodes. When a node forks or falls behind, the node synchronizes blocks by bulk fetching a specified number of blocks to the RequestBlocks interface through which the target node is called.

```
rpc RequestBlocks (BlocksRequest) returns (BlockList) {}
```

· BlocksRequest Message

```
message BlocksRequest {
    aelf.Hash previous_block_hash = 1;
    int32 count = 2;
}
```

- previous_block_hash: the previous block hash of the request blocks, and the result does not contain this block.
- count: the number of blocks you want to request.
- BlockList Message

```
message BlockList {
    repeated BlockWithTransactions blocks = 1;
}
```

- blocks: the requested blocks, including complete blocks and transactions information.

11.3.4 Peer Management

Ping

Interface Ping is used between nodes to verify that each other's network is available.

```
rpc Ping (PingRequest) returns (PongReply) {}

message PingRequest {
```

```
message PongReply {
}
```

11.3. Protocol 103

CheckHealth

The interface CheckHealth is invoked for other nodes' health checks, and each node periodically traverses the available peers in its own Peer Pool to send health check requests and retries or disconnects if an exception in the Peer state is found.

```
rpc CheckHealth (HealthCheckRequest) returns (HealthCheckReply) {}

message HealthCheckRequest {
}

message HealthCheckReply {
}
```

CHAPTER 12

Address

12.1 Overview

The changes of the state of an AEIf blockchain are driven by the execution of transactions. An Address can identify one of the participants of a transaction, that is, either transaction sender or destination. The sender is marked as From in a transaction, and the destination is marked as To.

Actually, From can be a User Address, a Contract Address, or a Virtual Address, but To can only be a Contract Address, which means the transaction sender wants to construct a transaction to execute a certain method in that Smart Contract.

Here are some further explanations of all kinds of Address in an AEIf blockchain.

12.2 User Address

User Address is generated from one key pair instance. One key pair is possessed by a real user of this AEIf blockchain.

This is the defination of interface IAElfAsymmetricCipherKeyPair.

```
public interface IAElfAsymmetricCipherKeyPair
{
    byte[] PrivateKey { get; }
    byte[] PublicKey { get; }
}
```

Currently, in AEIf blockchain, we use ECKeyPair to implement this interface, just like most of other blockchain systems. Users can use *aelf-command* tool to generate themselves a valid ECKeyPair, thus generate a unique User Address.

User can easily create a key pair with command line tool with the create command.

```
aelf-command create
```

Creation will be successful after you provide a valid password. When creating the key-pair (that we sometimes refer to as the "account") it will generate a file with the ".json" extension. This file will contain the public and private key and will be encrypted with the password you provided before.

If you are writing a dApp you can also use the following method in the *js-sdk*', it is based on bip39 for generating a deterministic key pair with a "mnemonic sentence":

```
import Aelf from 'aelf-sdk';
Aelf.wallet.createNewWallet();
```

This will return an object containing the mnemonic used, the key-pair and the address. In AEIf we usually encode the address in base58. This address is derived from the public, we calculate it as the first 30 bytes of the double sha256 hash. The AEIf js-sdk provides the following, that returns the address:

```
import Aelf from 'aelf-sdk';
const address = aelf.wallet.getAddressFromPubKey(pubKey);
```

Finally here is the Protobuf message we use for representing an address, it is often used by other types to represent addresses:

```
option csharp_namespace = "AElf.Types";
message Address
{
   bytes value = 1;
}
```

Also, the structure of Hash is very similar to Address.

12.3 Contract Address

Contract Address can identify a Smart Contract in an AEIf blockchain. The Contract Address is calculated with chain id and a serial number during the deployment of related Smart Contract.

12.4 Contract Virtual Address

As an extended function, every contract can be added with a Hash value based on its Address, then it can obtain unlimited virtual Addresses, this newly created address is called **Virtual Address**.

For example, the account transfer in AEif blockchain is to send the **Transfer** transaction to the MultiToken contract along with the parameters of the recipient, transfer currency and amount, etc. One account transfer involves the sender and recipient, and both parties are identified by the Address. In this situation, the Virtual Address, which is created by Address and Hash algorithm, can be either party of the account transfer like the normal Address for the user or

contract. What's more, Virtual Address can only be controlled by the primary contract, this enables the contract to custody transactions or fundings independently for every user.

In essence, the characteristic of Virtual Address is a unique identification. As a result, the Virtual Address, which is generated by a business action on this contract, is reliable to be used for token transferring.

108 Chapter 12. Address

CHAPTER 13

Overview

Transactions ultimately are what will change the state of the blockchain by calling methods on smart contracts. A transaction is either sent to the node via RPC or received from the network. When broadcasting a transaction and if valid it will be eventually included in a block. When this block is received and executed by the node, it will potential change the state of contracts.

13.1 Smart Contract

In AEIf blockchain, smart contracts contains a set of **state** definitions and a set of methods which aiming at modifing these **state**s.

13.2 Action & View

In AEIf blockchain, there are two types of smart contract methods, actions and views. Action methods will actually modify the state of one contract if a related transaction has included in a block and executed successfully. View methods cannot modify the state of this contract in any case.

Developers can claim a action method in proto file like this:

```
rpc Vote (VoteInput) returns (google.protobuf.Empty) {
}
```

And claim a view method like this:

```
rpc GetVotingResult (GetVotingResultInput) returns (VotingResult) {
    option (aelf.is_view) = true;
}
```

13.3 Transaction Instance

Here's the defination of the Transaction.

```
option csharp_namespace = "AElf.Types";

message Transaction {
    Address from = 1;
    Address to = 2;
    int64 ref_block_number = 3;
    bytes ref_block_prefix = 4;
    string method_name = 5;
    bytes params = 6;
    bytes signature = 10000;
}
```

In the js sdk, there are multiple methods to work with transactions. One important method is the **getTransaction** method that will build a transaction object for you:

```
import Aelf from 'aelf-sdk';
var rawTxn = proto.getTransaction('65dDNxzcd35jESiidFXN5JV8Z7pCwaFnepuYQToNefSgqk9'

→'65dDNxzcd35jESiidFXN5JV8Z7pCwaFnepuYQToNefSgqk9', 'SomeMethod', encodedParams);
```

This will build the transaction to the contract at address "65dDNxzcd35jESiidFXN5JV8Z7pCwaFnepuYQToNefSgqk9" that will call **SomeMethod** with encoded params.

13.3.1 From

The address of the sender of a transaction.

Note that the **From** is not currently useful because we derive it from the signature.

13.3.2 To

The address of the contract when calling a contract.

13.3.3 MethodName

The name of a method in the smart contract at the **To** address.

13.3.4 Params

The parameters to pass to the aforementioned method.

13.3.5 Signature

When signing a transaction it's actually a subset of the fields: from/to and the target method as well as the parameter that were given. It also contains the reference block number and prefix.

You can use the js-sdk to sign the transaction with the following method:

```
import Aelf from 'aelf-sdk';
var txn = Aelf.wallet.signTransaction(rawTxn, wallet.keyPair);
```

13.3.6 RefBlockNumber & RefBlockPrefix

These two fields measure whether this transaction has expired. The transaction will be discarded if it is too old.

13.4 Transaction Id

The unique identity of a transaction. Transaction Id consists of a cryptographic hash of the instance basic fields, excluding signature.

Note that the Transaction Id of transactions will be the same if the sender broadcasted several transactions with the same origin data, and then these transactions will be regarded as one transaction even though broadcasting several times.

13.4.1 Verify

One transaction now is verified by the node before forwarding this transaction to other nodes. If the transaction execution is failed, the node won't forward this transaction nor package this transaction to the producing block.

We have several transaction validationi providers such as:

- BasicTransactionValidationProvider. To verify the transaction signature and size.
- TransactionExecutionValidationProvider. To pre-execute this transaction before forwarding this transaction or really packaging this transaction to new block.
- TransactionMethodValidationProvider. To prevent transaction which call view-only contract method from packaging to new block.

13.4.2 Execution

In AEIf, the transaction is executed via .net reflection mechanism.

Besides, we have some transaction execution plugins in AEIf main net. The execution plugins contain pre-execution plugins and post-execution plugins.

- FeeChargePreExecutionPlugin. This plugin is for charging method fees from transaction sender.
- MethodCallingThresholdPreExecutionPlugin. This plugin is for checking the calling threshold of a specific contract or contract method.
- ResourceConsumptionPostExecutionPlugin. This plugin is for charging resource tokens from called contract after transaction execution (thus we can know how much resource tokens are cost during the execution.)

13.4.3 TransactionResult

Data structure of TransactionResult:

13.4. Transaction Id

```
message TransactionResourceInfo {
    repeated aelf.ScopedStatePath write_paths = 1;
    repeated aelf.ScopedStatePath read_paths = 2;
    ParallelType parallel_type = 3;
    aelf.Hash transaction_id = 4;
    aelf.Hash contract_hash = 5;
    bool is_nonparallel_contract_code = 6;
}
```

CHAPTER 14

Core

14.1 Application pattern

We follow generally accepted good practices when it comes to programming, especially those practices that make sense to our project. Some practices are related to C# and others are more general to OOP principles (like SOLID, DRY...).

Even though it's unusual for blockchain projects, we follow a domain driven design (DDD) approach to our development style. Part of the reason for this is that one of our main frameworks follows this approach and since the framework is a good fit for our needs, it's natural that we take the same design philosophy.

A few key points concerning DDD:

- traditionally, four layers: presentation, application, domain and infrastructure.
- presentation for us corresponds to any type of dApp.
- application represents exposed services mapped to the different domains.
- domain represents the specific events related to our blockchain system and also domain objects.
- finally infra are the third party libraries we use for database, networking...

We also have a Github issue where we list some of the coding standards that we follow while developing AElf.

14.1.1 Frameworks and libraries:

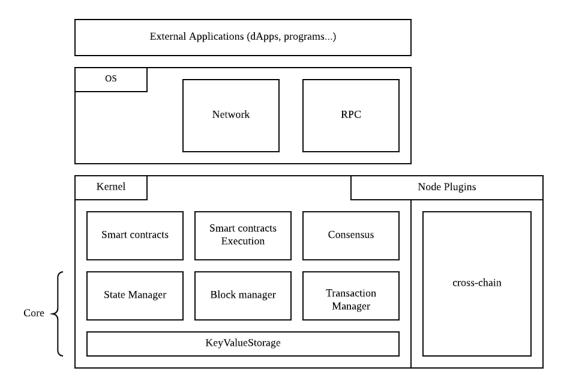

The main programming language used to code and build AEIf is C# and is built with the dotnet core framework. It's a choice that was made due to the excellent performances observed with the framework. Dotnet core also comes with the benefit of being cross platform, at least for the three main ones that are Windows, MacOS and Linux. Dotnet core also is a dynamic and open source framework and comes with many advantages of current modern development patterns and is backed by big actors in the IT space.

At a higher level we use an application framework named ABP. From a functional point of view, a blockchain node is a set of endpoints, like RPC, P2P and cross-chain and some higher level protocol on top of this. So ABP is a natural fit for this, because it offers a framework for building these types of applications.

We use the XUnit framework for our unit tests. We also have some custom made frameworks for testing smart contracts.

For lower level, we use gRPC for the cross-chain and p2p network communication. Besides for gRPC, we also use Protobuf for serialization purposes.

14.2 Design principles:

The above diagram shows the conceptual structure of the node and the separation between OS and Kernel.

14.2.1 OS

The OS layer implements the application and infrastructure layer for the network. It also implements the high level handlers for network events and job, like for example synchronizing the chain in reaction to a block announcement. The OS layer also contains the RPC implementation for the exposed API.

Kernel

The kernel contains the smart contract and execution primitives and definitions. The kernel also defines the components necessary for accessing the blockchain's data. Various managers will use the storage layer to access the underlying database.

The kernel also defines the notion of plugins. The diagram show that the side chain modules are implemented as plugins.

114 Chapter 14. Core

Structure of the project:

To help follow AElf's structure this section will present you with an overview of the solution.

Conceptually, AEIf is built on two main layers: OS and Kernel. The OS contains the high level definition for a node and the endpoints like RPC and p2p, whereas the kernel mainly contains logic and definitions for smart contracts and consensus.

AEIf has a native runtime for smart contracts which is implemented in C# and for contracts written in C#. The implementation is the AEIf.Runtime.CSharp.* projects.

A big part of AEIf is the side chain framework. It is mainly implemented in the AEIf.CrossChain namespace and defines the main abstractions in the **core** project and an implementation with grpc in the AEIf.Crosschain.Grpc project.

The AEIf.Test solution folder contains all the tests, coverage of the main functional aspects must be at a maximum to ensure the quality of our system.

Finally there are other projects that implement either libraries we use, like the crypto library and others for infrastructure like the database library, that are not as important but are still worth looking into.

14.2.2 Jobs and event handlers

Event handlers implement the logic that reacts to external in internal events. They are in a certain sense the higher levels of the application (they are called by the framework in purely domain agnostic way). An event handler, mostly using other services will influence the state of the chain.

14.2.3 Modules

We currently base our architecture on modules that get wired together at runtime. Any new module must inherit **AElfModule**.

Give the need to implement a new module, it usually follows the following steps: 1. Write the event handler or the job. 2. implement the interface and create manager or infrastructure layer interface that is needed. 3. implement the infrastructure layer interface in the same project in it do not need add dependency. 4. implement the infrastructure layer interface in another project, if it need third party dependency, for example, you can add GRPC / MongoDB / MySQL in the new project.

Example: the p2p network module.

The networking code is defined amongst 2 modules: **CoreOSAElfModule** and **GrpcNetworkModule**. The OS core defines the application service (used by other components of the node) and also implements it since it is application/domain logic. Whereas the infrastructure layer (like the server endpoint), is defined in the OS core modules but is implemented in another project that relies on a third party - gRPC in this case.

14.2.4 Testing

When writing a new component, event handler, method... It's important for AEIf's quality to consider the corresponding unit test. As said previously we have a solution-wide test folder where we place all the tests.

116 Chapter 14. Core

CHAPTER 15

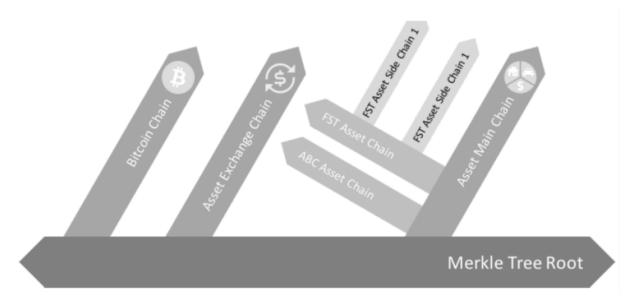

Cross Chain

15.1 Introduction

One of the major issues with current blockchain systems is scalability. Mainly because of **congestion problems** of current blockchains, the problem is that when a single chain needs to sequentially order and process transactions, in the event of a popular dApp taking up a lot of resources, it has negative side effects on other dApps.

This is why AEIf side chains were introduced in the initial design. It's envisioned that one side-chain is responsible for handling one or more similar business scenarios, distributing different tasks on multiple chains and improving the overall processing efficiency.

The main idea is that the side-chains are **independent** and **specialized** to ensure that the dapps running on them can perform efficiently and smoothly. A network link will exist between main-chain node and side-chain nodes, but the communication is indirectly done through what's called a Merkle root.

The diagram above illustrates the conceptual idea behind side chains.

Side chains are isolated but still need a way to interact with each other for this AElf introduces a communication mechanism through **merkle roots** and **indexing** to enable cross chain verification scenarios.

The following sections of this documentation will give you an overview of the architecture of AEIf's side chains. There will also be a guide explaining how to set up a main-chain and a side chain node.

15.2 Overview

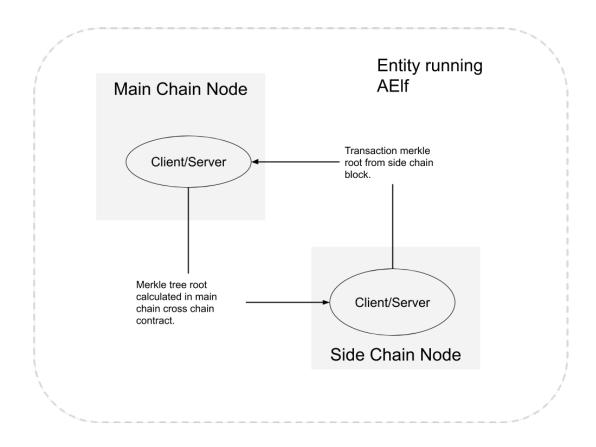

Conceptually a side chain node and main chain node are similar, they are both independent blockchains, with their own peer-to-peer network and possibly their own ecosystem. It is even possible to have this setup on multiple levels. In terms of peer-to-peer networks, all side chains work in parallel to each other but they are linked to a main chain node through a cross-chain communication mechanism.

Through this link, messages are exchanged and indexing is performed to ensure that transactions from the main-chain or other side chains are verifiable in the side chain. Implementers can use AElf libraries and frameworks to build chains.

One important aspect is the key role that the main chain plays, because its main purpose is to index the side chains. Only the main chain indexes data about all the side chains. Side chains are independent and do not have knowledge about each other. This means that when they need to verify what happened in other chains, they need the main chain as a bridge to provide the cross chain verification information.

15.2.1 Node level architecture

In the current architecture, both the side chain node and the main chain node has one server and exactly one client. This is the base for AEIf's two-way communication between main chain and side chains. Both the server and the client are implemented as a node plugins (a node has a collection of plugins). Interaction (listening and requesting) can start when both the nodes have started.

The diagram above illustrates two nodes run by an entity: one main chain node and one side chain node. Note that the nodes don't have to be in the same physical location.

Side chain lifetime

Side chain lifetime involves the following steps.

- · Request side chain creation.
- Wait for accept on main chain.
- Start and initialize side chain and it will be indexed by main chain automatically.
- It is allowed to do cross chain verification iff side chain is indexed correctly.

Communication

When the side chain node starts it will initiate a number of different communications, here are the main points of the protocol:

- When the side chain node is started for the first time it will request the main chain node for a chain initialization context.
- After initialization the side chain is launched and will perform a handshake with main chain node to signal that it is ready to be indexed.

15.2. Overview 119

• During the indexing process, the information of irreversible blocks will be exchanged between side chain and main chain. The main chain will write the final result in block which is calculated with the cross chain data from all side chains. Side chain is also recording the data in contract from main chain.

AEIf provides the cross chain communication implementation with grpc.

```
rpc RequestIndexingFromParentChain (CrossChainRequest) returns (stream acs7.

→ParentChainBlockData) {}

rpc RequestIndexingFromSideChain (CrossChainRequest) returns (stream acs7.

→SideChainBlockData) {}
```

Cache

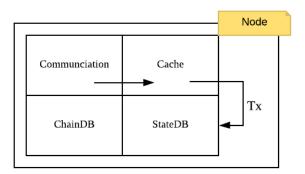

For effective indexing, a cache layer is used to store cross chain data received from remote nodes, and make it available and correct. Cross chain data is cached by chain id and block height with a count limit. The cache layer can give the data if cached when the node needs it. So cache layer decouples the communication part and node running logic.

Cross chain contract

Apart from the data in block, most cross chain data will be stored by the cross chain contract. Cross chain data cached by the node is packed in transaction during the mining process and the calculated result is stored by the contract. Actually, the cross chain data in the block is the side chain indexing result of calculations in this contract. Only with data in this contract can cross chain verification work correctly.

Data flow

Conceptually the node is like described in the following diagram. Main/Side chain node gets the cross chain data from the other side and put it in the local memory. Indexing transaction will be packed by miner and cross chain data would go into State through Crosschain Contract.

15.3 Cross chain verification

Verification is the key feature that enables side chains. Because side chains do not have direct knowledge about other side chains, they need a way to verify information from other chains. Side chains need the ability to verify that a transaction was included in another side chains block.

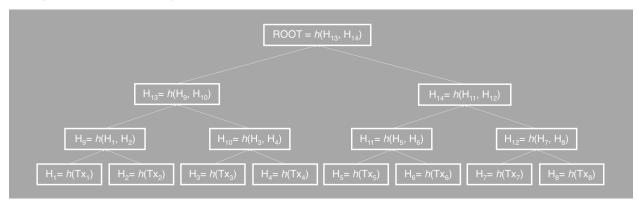

15.3.1 Indexing

The role of the main chain node is to index all the side chains blocks. This way it knows exactly the current state of all the side chains. Side chains also index main chain blocks and this is how they can gain knowledge about the inclusion of transactions in other chains.

Indexing is a continuous process, the main chain is permanently gathering information from the side chains and the side chains are permanently getting information from the main chain. When a side chain wants to verify a transaction from another side chain it must wait until the correct main chain block has been indexed.

15.3.2 Merkle tree

Merkle tree is a basic binary tree structure. For cross-chain in AElf, leaf value is the hash from transaction data. Node value (which is not a leaf node) is the hash calculated from its children values until to the tree root.

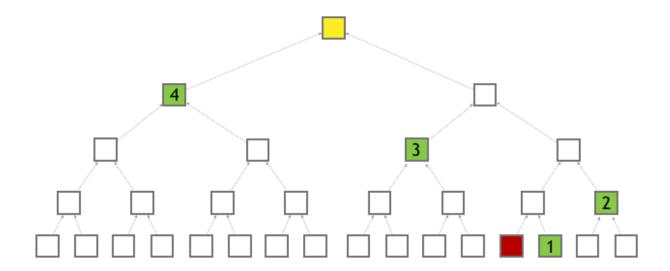

15.3.3 Merkle root

When a transaction gets included in a side chain's block the block will also include a merkle root of the transactions of this block. This root is local to this side chain's blockchain and by itself of little value to other side chains because they follow a different protocol. So communication between side chains goes through the main chain in the form of a merkle path. During indexing process, main chain is going to calculate the root with the data from side chains, and side chains in turn get the root in future indexing. This root is used for final check in cross chain transaction verification.

15.3.4 Merkle path

Merkle path is the node collection for one leaf node to calculate with to the root. Correct merkle path is necessary to complete any work related to cross chain verification. For the transaction **tx** from chain **A**, you need the whole merkle path root for **tx** to calculate the final root if you want to verify the existence of this transaction on other chains, and verify the root by checking whether it is equal to the one obtained from indexing before.

15.4 Cross chain verify

This section will explain how to verify a transaction across chains. It assumes a side chain is already deployed and been indexed by the main-chain.

15.4.1 Send a transaction

Any transaction with status Mined can be verified, the only pre-condition is that the transaction was indexed.

15.4.2 Verify the transaction

There's basically two scenarios that can be considered:

- · verifying a main-chain transaction.
- · verifying a side-chain transaction.

```
rpc VerifyTransaction (VerifyTransactionInput) returns (google.protobuf.BoolValue) {
  option (aelf.is_view) = true;
}

message VerifyTransactionInput {
   aelf.Hash transaction_id = 1;
   aelf.MerklePath path = 2;
   int64 parent_chain_height = 3;
   int32 verified_chain_id = 4;
}
```

VerifyTransaction is the view method of the cross-chain contract and that will be used to perform the verification. It returns whether the transaction was mined and indexed by the destination chain. This method will be used in both scenarios, what differs is the input:

Verify a main-chain tx

Verifying a main-chain transaction on a side chain, you can call **VerifyTransaction** on the side-chain with the following input values:

- parent_chain_height the height of the block, on the main-chain, in which the transaction was packed.
- transaction_id the ID of the transaction that you want to verify.
- path the merkle path from the main-chain's web api with the **GetMerklePathByTransactionIdAsync** with the ID of the transaction.
- verified_chain_id the source chainId, here the main chain's.

You can get the MerklePath of transaction in one block which packed it by chain's web api with the **Get-MerklePathByTransactionIdAsync** (See *web api reference*).

Verify a side-chain tx

First, you also need the query result of **GetMerklePathByTransactionIdAsync**, just like verification for a main-chain tx.

And then if you want to verify a a side-chain transaction, you need to get the CrossChainMerkleProofContext of this tx from the source chain. You can try the **GetBoundParentChainHeightAndMerklePathByHeight** method of Crosschain contract.

The input of this api is the height of block which packed the transaction. And it will return merkle proof context

With the result returned by above api, you can call **VerifyTransaction** on the target chain with the following input values:

- transaction_id the ID of the transaction that you want to verify.
- parent_chain_height use the bound_parent_chain_height field of CrossChainMerkleProofContext .
- path the concatenation of 2 merkle paths, in order:
 - the merkle path of the transaction, use the web api method **GetMerklePathByTransactionIdAsync**.
 - use the merkle_path_from_parent_chain field from the CrossChainMerkleProofContext object.
- verified_chain_id the source chainId, here the side chain on which the transaction was mined.

15.5 Cross chain transfer

Cross chain transfer is one of mostly used cases when it comes to cross chain verification. AEIf already supports cross chain transfer functionality in contract. This section will explain how to transfer tokens across chains. It assumes a side chain is already deployed and been indexed by the main chain.

The transfer will always use the same contract methods and the following two steps: - initiate the transfer - receive the tokens

15.5.1 Prepare

Few preparing steps are required before cross chain transfer, which is to be done only once for one chain. Just ignore this preparing part if already completed.

Let's say that you want to transfer token FOO from chain A to chain B. Note that please make sure you are already clear about how cross chain transaction verification works before you start. Any input containsMerklePath in the following steps means the cross chain verification processing is needed. See *cross chain verification* for more details.

• Validate Token Contract address on chain A.

Send transaction tx_1 to Genesis Contract with method ValidateSystemContractAddress. You should provide $system_contract_hash_name$ and address of Token Contract . tx_1 would be packed in block successfully.

• Register token contract address of chain A on chain B.

Create a proposal, which is proposed to RegisterCrossChainTokenContractAddress, for the default parliament organization (check *Parliament contract* for more details) on chain B. Apart from cross chain verification context, you should also provide the origin data of tx_1 and Token Contract address on chain A.

• Validate TokenInfo of *FOO* on chain *A*.

Send transaction tx_2 to Token Contract with method ValidateTokenInfoExists on chain A. You should provide TokenInfo of FOO. tx_2 would be packed in block successfully.

(continues on next page)

(continued from previous page)

```
aelf.Address issuer = 5;
bool is_burnable = 6;
int32 issue_chain_id = 7;
}
```

• Create token *FOO* on chain *B*.

Send transaction tx_3 to Token Contract with method CrossChainCreateToken on chain B. You should provide the origin data of tx_2 and cross chain verification context of tx_2 .

15.5.2 Initiate the transfer

On the token contract of source chain, it's the CrossChainTransfer method that is used to trigger the transfer:

```
rpc CrossChainTransfer (CrossChainTransferInput) returns (google.protobuf.Empty) { }

message CrossChainTransferInput {
   aelf.Address to = 1;
   string symbol = 2;
   sint64 amount = 3;
   string memo = 4;
   int32 to_chain_id = 5;
   int32 issue_chain_id = 6;
}
```

The fields of the input:

- to the target address to receive token
- symbol symbol of token to be transferred
- amount amount of token to be transferred
- memo memo field in this transfer
- to chain id destination chain id on which the tokens will be received
- issue_chain_id the chain on which the token was issued

15.5.3 Receive on the destination chain

On the destination chain tokens need to be received, it's the CrossChainReceiveToken method that is used to trigger the reception:

Let's review the fields of the input

· from chain id

the source chain id on which cross chain transfer launched

• parent_chain_height

- for the case of transfer from main chain to side chain: this parent_chain_height is the height of the block on the main chain that contains the CrossChainTransfer transaction.
- for the case of transfer from side chain to side chain or side chain to main-chain: this parent_chain_height is the result of GetBoundParentChainHeightAndMerklePathByHeight (input is the height of the Cross-ChainTransfer, see cross chain verification) accessible in the bound_parent_chain_height field.

· transfer transaction bytes

the serialized form of the CrossChainTransfer transaction.

· merkle_path

You should get this from the source chain but merkle path data construction differs among cases.

- for the case of transfer from main chain to side chain
 - * only need the merkle path from the main chain's web api GetMerklePathByTransactionIdAsync (CrossChainTransfer transaction ID as input).
- for the case of transfer from side chain to side chain or from side chain to main chain
 - * the merkle path from the source chain's web api GetMerklePathByTransactionIdAsync (CrossChainTransfer transaction ID as input).
 - * the output of GetBoundParentChainHeightAndMerklePathByHeight method in Cross chain Contract (CrossChainTransfer transaction's block height as input). The path nodes are in the merkle_path_from_parent_chain field of the CrossChainMerkleProofContext object.
 - * Concat above two merkle path.

Smart contract

16.1 Smart contract architecture

At its core, a blockchain platform can be viewed as a distributed multi-tenant database that holds the state of all the smart contracts deployed on it. After deployment, each smart contract will have a unique address. The address is used to scope the state and as the identifier for state queries and updates. The methods defined in the smart contract code provides the permission checks and logics for queries and updates.

In aelf, a smart contract essentially has three parts: the interface, the state, and the business logic.

- 1. **the interface** aelf supports smart contracts coded in multiple languages. Protobuf format is adopted as the cross-language definition of the contract.
- 2. **the state** the language specific SDK provides some prototypes for the state of different types, after the defination of properties of certain prototype, developers could query and update *state database* via accessing the properties directly.
- 3. **the business logic** aelf provides protobuf plugins to generate the smart contract skeleton from the contract's proto definition. Developers just need to fill the logics for each method by override.

Smart contracts in AEIf are spread across the Kernel, the runtime and the SDK. The kernel defines the fundamental components and infrastructure associated with smart contracts. It also defines the abstractions for execution. Smart contract also heavily rely on the runtime modules and the sdk project.

Smart contracts, along with the blockchain's data, form the heart of a blockchain system. They define through some predefined logic how and according to what rules the state of the blockchain is modified.

A smart contract is a collection of methods that each act upon a particular set of state variables.

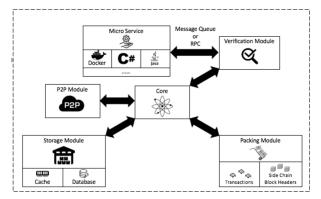

Transactions trigger the logic contained in smart contracts. If a user of the blockchain wants to modify some state, he needs to build a transaction that will call a specific method on some contract. When the transaction is included in a block and this block is executed, the modifications will be executed.

Smart contracts are a part of what makes dApps possible. They implement a part of the business layer: the part that gets included in the blockchain.

What follows in this section will give you a general overview of how AEIf implements smart contracts. The other sections will walk you through different notions more specifically.

16.1.1 Architecture overview

In AEIf, Smart Contracts are defined like micro-services. This makes Smart Contracts independent of specific programming languages. This implies, for example, that our Consensus Protocol essentially becomes a service because it is defined through Smart Contract.

As showed in the diagram above, smart contracts functionality is defined within the kernel. The kernel defines the fundamental components and infrastructure associated with establishing smart contracts as a service: * SDK abstracts - high-level entities that provide a hook for smart contract services to interact with the chain. * Execution - high-level primitives defined for execution

16.1.2 Chain interactions

Smart contract need to interact with the chain and have access to contextual information. For this AEIf defines a bridge and a bridge host. Usually the programming SDK corresponding to the specific language will implement features to communicate with/through the bridge.

One of the major functionalities provided by the bridge is the ability to provide contextual information to the smart contract being executed. Here are a few: the **Self** field represents the address of the current contract being called. the **Sender** is the address that sent the transaction that executed the contract, and **Origin** is the address that signed the transaction. Sometimes **Sender** and **Origin** are equal.the **OriginTransactionId** is the ID of the transaction fetch from transaction pool or generated by the current miner, and **TransactionId** is the Id of the transaction is executing, which means this transaction could be an inline one.

The bridge also exposes extra functionality: contracts can fire **Events**, which are in a way similar to logging. contracts can call a method on another contract in a read-only manner. Any state change will not be persisted to the blockchain. Send inline - this actually creates a transaction to call another method. As opposed to calling the changes to the state - if any - will be persisted.

State

The main point of a smart contract is to read and/or modify state. The language SDK's implement state helpers and through the bridge's **StateProvider**.

16.1.3 Runtime and execution

When a block's transactions are executed, every transaction will generate a trace. Amongst other things, it contains: the return value of the called method, this can be anything defined in protobuf format and is defined in the service definition. error outputs, if execution encountered a problem. the results from inner calls in **InlineTraces** field. the **Logs** field will contain the events launched from the called method.

16.1.4 Sdk

AEIf comes with a native C# SDK that gives smart contract developers the necessary tools to develop smart contracts in C#. It contains helpers to communicate with the bridge. By using the SDK, you can also take advantage of the type infrastructure defined in the library: ContractState: an interface that is implemented by a class that is destined to be containers for the state field. MappedState: a base type that defines **collections** a key-value mapping, generic subclasses are available to enable multi-key scenarios. SingletonState: this defines **non-collection** types with a

Any developer or company can develop an sdk and a runtime for a specific language by creating an adapter to communicate with the bridge through gRPC.

16.2 Smart contract service

When writing a smart contract in AEIf the first thing that need to be done is to define it so it can then be generate by our tools. AEIf contracts are defined as services that are currently defined and generated with gRPC and protobuf.

As an example, here is part of the definition of our multi-token contract. Each functionality will be explained more in detail in their respective sections. Note that for simplicity, the contract has been simplified to show only the essential.

```
syntax = "proto3";

package token;
option csharp_namespace = "AElf.Contracts.MultiToken.Messages";

service TokenContract {
    option (aelf.csharp_state) = "AElf.Contracts.MultiToken.TokenContractState";

    // Actions
    rpc Create (CreateInput) returns (google.protobuf.Empty) { }
    rpc Transfer (TransferInput) returns (google.protobuf.Empty) { }

    // Views
    rpc GetBalance (GetBalanceInput) returns (GetBalanceOutput) {
        option (aelf.is_view) = true;
    }
}
```

For the service we have two different types of methods:

- Actions these are normal smart contract methods that take input and output and usually modify the state of the chain.
- Views these methods are special in the sense that they do not modify the state of the chain. They are usually used in some way to query the value of the contracts state.

```
rpc Create (CreateInput) returns (google.protobuf.Empty) { }
```

The services takes a protobuf message as input and also returns a protobuf message as output. Note that here it returns a special message - google.protobuf.Empty - that signifies returning nothing. As a convention we append Input to any protobuf type that is destined to be a parameter to a service.

16.2.1 View option

```
rpc GetBalance (GetBalanceInput) returns (GetBalanceOutput) {
   option (aelf.is_view) = true;
}
```

This service is annotated with a view option. This signifies that this is a readonly method and will not modify the state.

16.3 Smart contract events

16.3.1 Event option

During the execution, Events are used internally to represent events that have happened during the execution of a smart contract. The event will be logged in the transaction traces logs (a collection of LogEvents).

```
message Transferred {
    option (aelf.is_event) = true;
    aelf.Address from = 1 [(aelf.is_indexed) = true];
    aelf.Address to = 2 [(aelf.is_indexed) = true];
    string symbol = 3 [(aelf.is_indexed) = true];
    sint64 amount = 4;
    string memo = 5;
}
```

Notice the option (aelf.is_event) = true; line which indicates that the **Transferred** message is destined to be an event.

The following code demonstrates how to fire the event in a contract:

```
Context.Fire (new Transferred()
{
    From = from,
    To = to,
    ...
});
```

External code to the contract can monitor this after the execution of the transaction.

16.4 Smart contract messages

Here we define the concept of the message as defined by the protobuf language. We heavily use these messages to call smart contracts and serializing their state. The following is the definition of a simple message:

```
message CreateInput {
    string symbol = 1;
    sint64 totalSupply = 2;
    sint32 decimals = 3;
}
```

Here we see a message with three fields of type string, sint64 and sint32. In the message, you can use any type supported by protobuf, including composite messages, where one of your messages contains another message.

For message and service definitions, we use the **proto3** version of the protobuf language. You probably won't need to use most of the features that are provided, but here's the full reference for the language.

16.5 Development Requirements and Restrictions

There are several requirements and restrictions for a contract to be deployable that are classified into below categories:

16.5.1 Contract Project Requirements

Project Properties

• It is required to add ContractCode property in your contract project, so that the contract's DLL will be post processed by AElf's contract patcher to perform necessary injections that are required by code checks during deployment. Otherwise, deployment will fail.

• It is required to enable CheckForOverflowUnderflow for both Release and Debug mode so that your contract will use arithmetic operators that will throw OverflowException if there is any overflow. This is to ensure that execution will not continue in case of an overflow in your contract and result with unpredictable output.

If your contract contains any unchecked arithmetic operators, deployment will fail.

16.5.2 Contract Class Structure

Below restrictions are put in place to simplify code checks during deployment:

• Only 1 inheritance is allowed from ContractBase which is generated by the contract plugin as a nested type in ContractContainer and only 1 inheritance will be allowed from CSharpSmartContract. If there are multiple inheritances from ContractBase or CSharpSmartContract, code deployment will fail.

- Only 1 inheritance will be allowed from ContractState. Similar to above, if there are multiple inheritance from AElf.Sdk.ContractState, code check will fail.
- The type inherited from ContractState should be the element type of CSharpSmartContract generic instance type, otherwise code check will fail.

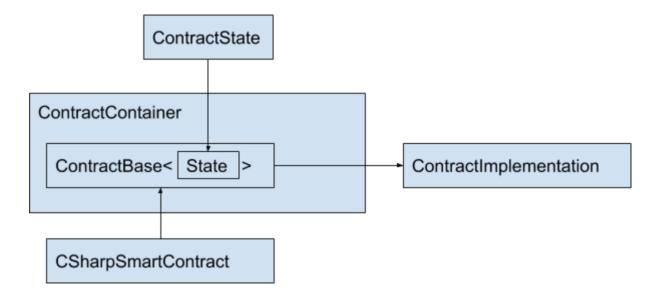

Fig. 1: Contract Class Structure

Limitations on Field Usage

In Contract Implementation Class

• Initial value for non-readonly, non-constant fields is not allowed. (Applied to all static / non-static fields) The reason is, their value will be reset to 0 or null after first execution and their initial value will be lost.

Allowed:

```
class MyContract : MyContractBase
{
  int test;
  static const int test = 2;
}
```

Not Allowed:

```
class MyContract : MyContractBase
{
! int test = 2;
}
```

```
class MyContract : MyContractBase
{
  int test;

public MyContract
```

(continues on next page)

(continued from previous page)

```
{
! test = 2;
}
}
```

• Only primitive types, or one of below types are allowed for readonly / constant fields:

Type	
All Primitive Types	
Marshaller <t></t>	
Method <t, t=""></t,>	
MessageParser <t></t>	
FieldCodec <t></t>	
MapField <t, t=""></t,>	
ReadonlyCollection <t></t>	
ReadonlyDictionary <t,< td=""><td>T></td></t,<>	T>

^{*} T can only be primitive type

In Non-Contract Classes (For classes that don't inherit from ContractBase<T>)

• Initial value for non-readonly, non-constant fields is not allowed for static fields. The reason is, their value will be reset to 0 or null after first execution and their initial value will be lost.

Allowed:

```
class AnyClass
{
   static int test;
}
```

Not Allowed:

```
class AnyClass
{
! static int test = 2;
}
```

```
class AnyClass
{
  static int test;

  public AnyClass
  {
    test = 2;
    }
}
```

Exception Case: Fields with FileDescriptor types. This is due to protobuf generated code. There are static fields FileDescriptor type fields generated by protobuf code and these fields don't have readonly modifier. We allow such fields only if they are FileDescriptor type and write access to these fields are only allowed from the constructor of the type where descriptor field is declared.

Allowed:

```
public class TestType
{
  private static FileDescriptor test;

  public class TestType
  {
    test = ...
  }
}
```

Not Allowed:

```
public class TestType
{
   private static FileDescriptor test;

   public TestType
   {
     test = ...
   }

! public void SetFromSomeWhereElse(FileDescriptor input)
! {
   test = input;
! }
}
```

Accessing to set test field is restricted to its declaring type's constructor only.

• Only below types are allowed for readonly / constant static fields:

Туре
All Primitive Types
Marshaller <t></t>
Method <t, t=""></t,>
MessageParser <t></t>
FieldCodec <t></t>
MapField <t, t=""></t,>
ReadonlyCollection <t></t>
ReadonlyDictionary <t, t=""></t,>

^{*} T can only be primitive type

Exception Case: If a type has a readonly field same type as itself, it is only allowed if the type has no instance field.

This is to support Linq related generated types.

Allowed:

```
public class TestType
{
  private static readonly TestType test;

  private static int i;
}
```

Not Allowed:

```
public class TestType
{
  private static readonly TestType test;

! private int i;
}
```

In Contract State

In contract state, only below types are allowed:

Primitive Types
BoolState
Int32State
UInt32State
Int64State
UInt64State
StringState
BytesState

Complex Types
SingletonState <t></t>
ReadonlyState <t></t>
MappedState <t, t=""></t,>
MappedState <t, t="" t,=""></t,>
MappedState <t, t="" t,=""></t,>
MappedState <t, t="" t,=""></t,>
MethodReference <t, t=""></t,>
ProtobufState <t></t>
ContractReferenceState

16.5.3 Type and Namespace Restrictions

Nodes checks new contract code against below whitelist and if there is a usage of any type that is not covered in the whitelist, or the method access or type name is denied in below whitelist, the deployment will fail.

16.5.4 Other Restrictions

GetHashCode Usage

- GetHashCode method is only allowed to be called within GetHashCode methods. Calling GetHashCode methods from other methods is not allowed. This allows developers to implement their custom GetHashCode methods for their self defined types if required, and also allows protobuf generated message types.
- It is not allowed to set any field within GetHashCode methods.

Execution observer

- AEIf's contract patcher will patch method call count observer for your contract. This is used to prevent infinitely
 method call like recursion. The number of method called in your contract will be counted during transaction
 execution. The observer will pause transaction execution if the number exceeds 15,000. The limit adjustment is
 governed by Parliament.
- AEIf's contract patcher will patch method branch count observer for your contract. This is used to prevent
 infinitely loop case. The number of code control transfer in your contract will be counted during transaction
 execution. The observer will pause transaction execution if the number exceeds 15,000. The limit adjustment is
 governed by Parliament. The control transfer opcodes in C# contract are shown as below.

Opcode
OpCodes.Beq
OpCodes.Beq_S
OpCodes.Bge
OpCodes.Bge_S
OpCodes.Bge_Un
OpCodes.Bge_Un_S
OpCodes.Bgt
OpCodes.Bgt_S
OpCodes.Ble
OpCodes.Ble_S
OpCodes.Ble_Un
OpCodes.Blt
OpCodes.Bne_Un
OpCodes.Bne_Un_S
OpCodes.Br
OpCodes.Brfalse
OpCodes.Brfalse_S
OpCodes.Brtrue
OpCodes.Brtrue
OpCodes.Brtrue_S
OpCodes.Br_S

State size limit

• The size of data written to State would be limited every time. AEIf's contract patcher is going to patch the code to validate your contract. As a result, you cannot write too big thing to contract and the limit is 128k by default. The limit adjustment is governed by Parliament.

CHAPTER 17

AELF API 1.0

17.1 Chain API

17.1.1 Get information about a given block by block hash. Optionally with the list of its transactions.

GET /api/blockChain/block

Parameters

Type	Name	Description	Schema	Default
Query	blockHash	block hash	string	
	optional			
Query	include Transactions	include transactions or not	boolean	"false"
	optional			

Responses

HTTP Code	Description	Schema
200	Success	BlockDto

Produces

- text/plain; v=1.0
- application/json; v=1.0
- text/json; v=1.0

• application/x-protobuf; v=1.0

Tags

• BlockChain

17.1.2 Get information about a given block by block height. Optionally with the list of its transactions.

GET /api/blockChain/blockByHeight

Parameters

Туре	Name	Description	Schema	Default
Query	blockHeight optional	block height	integer (int64)	
Query	include Transactions optional	include transactions or not	boolean	"false"

Responses

HTTP Code	Description	Schema
200	Success	BlockDto

Produces

- text/plain; v=1.0
- application/json; v=1.0
- text/json; v=1.0
- application/x-protobuf; v=1.0

Tags

• BlockChain

17.1.3 Get the height of the current chain.

GET /api/blockChain/blockHeight

Responses

HTTP Code	Description	Schema
200	Success	integer (int64)

Produces

- text/plain; v=1.0
- application/json; v=1.0
- text/json; v=1.0
- application/x-protobuf; v=1.0

Tags

• BlockChain

17.1.4 Get the current state about a given block

GET /api/blockChain/blockState

Parameters

Type	Name	Description	Schema
Query	blockHash optional	block hash	string

Responses

HTTP Code	Description	Schema
200	Success	BlockStateDto

Produces

- text/plain; v=1.0
- application/json; v=1.0
- text/json; v=1.0
- application/x-protobuf; v=1.0

Tags

• BlockChain

17.1. Chain API 141

17.1.5 Get the current status of the block chain.

GET /api/blockChain/chainStatus

Responses

HTTP Code	Description	Schema
200	Success	ChainStatusDto

Produces

- text/plain; v=1.0
- application/json; v=1.0
- text/json; v=1.0
- application/x-protobuf; v=1.0

Tags

• BlockChain

17.1.6 Get the protobuf definitions related to a contract

GET /api/blockChain/contractFileDescriptorSet

Parameters

Type	Name	Description	Schema
Query	address optional	contract address	string

Responses

HTTP Code	Description	Schema
200	Success	string (byte)

Produces

- text/plain; v=1.0
- application/json; v=1.0
- text/json; v=1.0
- application/x-protobuf; v=1.0

Tags

• BlockChain

17.1.7 POST /api/blockChain/executeRawTransaction

Parameters

Type	Name	Schema
Body	input optional	ExecuteRawTransactionDto

Responses

HTTP Code	Description	Schema
200	Success	string

Consumes

- application/json-patch+json; v=1.0
- application/json; v=1.0
- text/json; v=1.0
- application/*+json; v=1.0
- application/x-protobuf; v=1.0

Produces

TransactionId optional	string
TransactionSize optional	integer (int32)

17.2. Net API 159

CalculateTransactionFeeInput

Name	Schema
RawTrasaction optional	string

CalculateTransactionFeeOutput

Name	Schema
Success optional	bool
TransactionFee optional	Dictionary <string, long=""></string,>
ResourceFee optional	Dictionary <string, long=""></string,>

CHAPTER 18

Chain SDK

18.1 aelf-sdk.js - AELF JavaScript API

18.1.1 Introduction

aelf-sdk.js for aelf is like web.js for ethereum.

aelf-sdk.js is a collection of libraries which allow you to interact with a local or remote aelf node, using a HTTP connection.

The following documentation will guide you through installing and running aelf-sdk.js, as well as providing a API reference documentation with examples.

If you need more information you can check out the repo: aelf-sdk.js

18.1.2 Adding aelf-sdk.js

First you need to get aelf-sdk.js into your project. This can be done using the following methods:

```
npm: npm install aelf-sdk
pure js: link dist/aelf.umd.js
```

After that you need to create a aelf instance and set a provider.

18.1.3 Examples

You can also see full examples in ./examples;

Create instance

Create a new instance of AEIf, connect to an AELF chain node.

```
import AElf from 'aelf-sdk';

// create a new instance of AElf
const aelf = new AElf(new AElf.providers.HttpProvider('http://127.0.0.1:1235'));
```

Create or load a wallet

Create or load a wallet with AElf.wallet

```
```javascript
// create a new wallet
const newWallet = AElf.wallet.createNewWallet();
// load a wallet by private key
const priviteKeyWallet = AElf.wallet.getWalletByPrivateKey('xxxxxxx');
// load a wallet by mnemonic
const mnemonicWallet = AElf.wallet.getWalletByMnemonic('set kite ...');
```
```

3.Get a system contract address

Get a system contract address, take AElf.ContractNames.Token as an example

4.Get a contract instance

Get a contract instance by contract address

```
const wallet = AElf.wallet.createNewWallet();
let tokenContract;

// Use token contract for examples to demonstrate how to get a contract instance_
in different ways

// in async function
(async () => {
   tokenContract = await aelf.chain.contractAt(tokenContractAddress, wallet)
```

(continues on next page)

(continued from previous page)

5.Use contract instance

How to use contract instance

A contract instance consists of several contract methods **and** methods can be called **in_** —two ways: read-only **and** send transaction.

```
(async () => {
     // get the balance of an address, this would not send a transaction,
     // or store any data on the chain, or required any transaction fee, only get,
\rightarrowthe balance
     // with `.call` method, `aelf-sdk` will only call read-only method
     const result = await tokenContract.GetBalance.call({
       symbol: "ELF",
       owner: "7s4XoUHfPugoZAwnTV7pHWZAaivMiL8aZrDSnY9brE1woa8vz"
     });
     console.log(result);
     /**
        "symbol": "ELF",
       "owner": "2661mQaaPnzLCoqXPeys3Vzf2wtGM1kSrqVBgNY4JUaGBxEsX8",
       "balance": "1000000000000"
     1 */
     // with no `.call`, `aelf-sdk` will sign and send a transaction to the chain,...
→and return a transaction id.
     // make sure you have enough transaction fee `ELF` in your wallet
     const transactionId = await tokenContract.Transfer({
       symbol: "ELF",
       to: "7s4XoUHfPuqoZAwnTV7pHWZAaivMiL8aZrDSnY9brE1woa8vz",
       amount: "1000000000",
       memo: "transfer in demo"
     console.log(transactionId);
     /**
          "TransactionId": "123123"
   })()
```

6.Change the node endpoint

Change the node endpoint by using aelf.setProvider

```
```javascript
import AElf from 'aelf-sdk';

const aelf = new AElf(new AElf.providers.HttpProvider('http://127.0.0.1:1235'));
aelf.setProvider(new AElf.providers.HttpProvider('http://127.0.0.1:8000'));
```
```

18.1.4 Web API

You can see how the Web Api of the node works in {chainAddress}/swagger/index.html tip: for an example, my local address: 'http://127.0.0.1:1235/swagger/index.html'

parameters and returns based on the URL: https://aelf-public-node.aelf.io/swagger/index.html

The usage of these methods is based on the AEIf instance, so if you don't have one please create it:

```
import AElf from 'aelf-sdk';

// create a new instance of AElf, change the URL if needed
const aelf = new AElf(new AElf.providers.HttpProvider('http://127.0.0.1:1235'));
```

1.getChainStatus

Get the current status of the block chain.

Web API path

/api/blockChain/chainStatus

Parameters

Empty

Returns

Object

- ChainId String
- Branches Object
- NotLinkedBlocks Object
- LongestChainHeight Number
- LongestChainHash String
- GenesisBlockHash String
- GenesisContractAddress String
- LastIrreversibleBlockHash String
- LastIrreversibleBlockHeight Number
- BestChainHash String

• BestChainHeight - Number

Example

```
aelf.chain.getChainStatus()
.then(res => {
  console.log(res);
})
```

2.getContractFileDescriptorSet

Get the protobuf definitions related to a contract

Web API path

/api/blockChain/contractFileDescriptorSet

Parameters

1. contractAddress - String address of a contract

Returns

String

Example

```
aelf.chain.getContractFileDescriptorSet(contractAddress)
   .then(res => {
      console.log(res);
   })
```

3.getBlockHeight

Get current best height of the chain.

Web API path

/api/blockChain/blockHeight

Parameters

Empty

Returns

Number

Example

```
aelf.chain.getBlockHeight()
   .then(res => {
    console.log(res);
   })
```

4.getBlock

Get block information by block hash.

Web API path

/api/blockChain/block

Parameters

- 1. blockHash String
- 2. includeTransactions Boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

Object

- BlockHash String
- Header Object
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra Array
 - Height Number
 - Time google.protobuf.Timestamp
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body Object
 - TransactionsCount Number
 - Transactions Array
 - * transactionId String

Example

```
aelf.chain.getBlock(blockHash, false)
  .then(res => {
    console.log(res);
})
```

5.getBlockByHeight

Web API path

/api/blockChain/blockByHeight

Get block information by block height.

Parameters

- 1. blockHeight Number
- 2. includeTransactions Boolean:
- true require transaction ids list in the block

• false Doesn't require transaction ids list in the block

Returns

```
Object
```

- BlockHash String
- Header Object
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra Array
 - Height Number
 - Time google.protobuf.Timestamp
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body Object
 - TransactionsCount Number
 - Transactions Array
 - * transactionId String

Example

```
aelf.chain.getBlockByHeight(12, false)
  .then(res => {
    console.log(res);
})
```

6.getTxResult

Get the result of a transaction

Web API path

/api/blockChain/transactionResult

Parameters

1. transactionId - String

Returns

Object

- TransactionId String
- Status String
- Logs Array
 - Address String
 - Name String

```
- Indexed - Array
- NonIndexed - String

• Bloom - String

• BlockNumber - Number

• Transaction - Object
- From - String
- To - String
- RefBlockNumber - Number
- RefBlockPrefix - String
- MethodName - String
- Params - Object
- Signature - String

• ReadableReturnValue - Object
```

• ReadableReturnvalue - Objec

• Error - String

Example

```
aelf.chain.getTxResult(transactionId)
  .then(res => {
    console.log(res);
})
```

7.getTxResults

Get multiple transaction results in a block

Web API path

/api/blockChain/transactionResults

Parameters

- 1. blockHash String
- 2. offset Number
- 3. limit Number

Returns Array - The array of method descriptions:

• the transaction result object

Example

```
aelf.chain.getTxResults(blockHash, 0, 2)
   .then(res => {
    console.log(res);
})
```

8.getTransactionPoolStatus

Get the transaction pool status.

Web API path

/api/blockChain/transactionPoolStatus

Parameters

Empty

9.sendTransaction

Broadcast a transaction

Web API path

/api/blockChain/sendTransaction

POST

Parameters

Object - Serialization of data into protobuf data, The object with the following structure:

• RawTransaction - String:

usually developers don't need to use this function directly, just get a contract method and send transaction by call contract method:

10.sendTransactions

Broadcast multiple transactions

POST

Parameters

Object - The object with the following structure:

• RawTransaction - String

11.callReadOnly

Call a read-only method on a contract.

POST

Parameters

Object - The object with the following structure:

• RawTransaction - String

12.getPeers

Get peer info about the connected network nodes

GET

Parameters

- 1. withMetrics Boolean:
- true with metrics
- false without metrics

13.addPeer

Attempts to add a node to the connected network nodes

POST

Parameters

Object - The object with the following structure:

• Address - String

14.removePeer

Attempts to remove a node from the connected network nodes

DELETE

Parameters

1. address - String

15.calculateTransactionFee

Estimate transaction fee

POST

Parameters

Object - The object with the following structure:

• RawTransaction - String

16.networkInfo

Get information about the node's connection to the network

GET

Parameters

Empty

18.1.5 AEIf.wallet

AElf.wallet is a static property of AElf.

Use the api to see detailed results

1.createNewWallet

Returns

Object

- mnemonic String: mnemonic
- BIP44Path String: m/purpose'/coin_type'/account'/change/address_index
- childWallet Object: HD Wallet
- keyPair String: The EC key pair generated by elliptic
- privateKey String: private Key
- address String: address

Example

```
import AElf from 'aelf-sdk';
const wallet = AElf.wallet.createNewWallet();
```

2.getWalletByMnemonic

Parameters

```
1. mnemonic - String: wallet's mnemonic
```

Returns

Object: Complete wallet object.

Example

```
const wallet = AElf.wallet.getWalletByMnemonic(mnemonic);
```

3.getWalletByPrivateKey

Parameters

```
1. privateKey: String: wallet's private key
```

Returns

Object: Complete wallet object, with empty mnemonic

Example

```
const wallet = AElf.wallet.getWalletByPrivateKey(privateKey);
```

4.signTransaction

Use wallet keypair to sign a transaction

Parameters

```
    rawTxn - String
    keyPair - String
```

Returns

Object: The object with the following structure:

Example

```
const result = aelf.wallet.signTransaction(rawTxn, keyPair);
```

5.AESEncrypt

Encrypt a string by aes algorithm

Parameters

```
    input - String
    password - String
```

Returns

String

6.AESDecrypt

Decrypt by aes algorithm

Parameters

```
    input - String
    password - String
```

Returns

String

18.1.6 AElf.pbjs

The reference to protobuf.js, read the documentation to see how to use.

18.1.7 AEIf.pbUtils

Some basic format methods of aelf.

For more information, please see the code in src/utils/proto.js. It is simple and easy to understand.

AEIf.utils

Some methods for aelf.

For more information, please see the code in src/utils/utils.js. It is simple and easy to understand.

Check address

```
const AElf = require('aelf-sdk');
const {base58} = AElf.utils;
base58.decode('$addresss'); // throw error if invalid
```

18.1.8 AEIf.version

```
import AElf from 'aelf-sdk';
AElf.version // eg. 3.2.23
```

18.1.9 Requirements

- Node.js
- NPM

18.1.10 Support

18.1.11 About contributing

Read out [contributing guide]

18.1.12 About Version

https://semver.org/

18.2 aelf-sdk.cs - AELF C# API

This C# library helps in the communication with an AEIf node. You can find out more here.

18.2.1 Introduction

aelf-sdk.cs is a collection of libraries which allow you to interact with a local or remote aelf node, using a HTTP connection.

The following documentation will guide you through installing and running aelf-sdk.cs, as well as providing a API reference documentation with examples.

If you need more information you can check out the repo: aelf-sdk.cs

18.2.2 Adding aelf-sdk.cs package

First you need to get AElf.Client package into your project. This can be done using the following methods:

Package Manager:

```
PM> Install-Package AElf.Client
```

.NET CLI

```
> dotnet add package AElf.Client
```

PackageReference

```
<PackageReference Include="AElf.Client" Version="X.X.X" />
```

18.2.3 Examples

Create instance

Create a new instance of AElfClient, and set url of an AElf chain node.

```
using AElf.Client.Service;

// create a new instance of AElfClient
AElfClient client = new AElfClient("http://127.0.0.1:1235");
```

Test connection

Check that the AEIf chain node is connectable.

```
var isConnected = await client.IsConnectedAsync();
```

Initiate a transfer transaction

(continues on next page)

(continued from previous page)

```
// Generate a transfer transaction.
var transaction = await client.GenerateTransaction(ownerAddress, tokenContractAddress.
→ToBase58(), methodName, param);
var txWithSign = client.SignTransaction(PrivateKey, transaction);
// Send the transfer transaction to AElf chain node.
var result = await client.SendTransactionAsync(new SendTransactionInput
   RawTransaction = txWithSign.ToByteArray().ToHex()
});
await Task.Delay(4000);
// After the transaction is mined, query the execution results.
var transactionResult = await client.GetTransactionResultAsync(result.TransactionId);
Console.WriteLine(transactionResult.Status);
// Query account balance.
var paramGetBalance = new GetBalanceInput
{
    Symbol = "ELF",
   Owner = new Address {Value = Address.FromBase58(ownerAddress).Value}
};
var transactionGetBalance =await client.GenerateTransaction(ownerAddress,__
→tokenContractAddress.ToBase58(), "GetBalance", paramGetBalance);
var txWithSignGetBalance = client.SignTransaction(PrivateKey, transactionGetBalance);
var transactionGetBalanceResult = await client.ExecuteTransactionAsync(new,)
→ExecuteTransactionDto
   RawTransaction = txWithSignGetBalance.ToByteArray().ToHex()
var balance = GetBalanceOutput.Parser.ParseFrom(ByteArrayHelper.
→HexstringToByteArray(transactionGetBalanceResult));
Console.WriteLine(balance.Balance);
```

18.2.4 Web API

You can see how the Web Api of the node works in {chainAddress}/swagger/index.html tip: for an example, my local address: 'http://127.0.0.1:1235/swagger/index.html'

The usage of these methods is based on the AElfClient instance, so if you don't have one please create it:

```
using AElf.Client.Service;

// create a new instance of AElf, change the URL if needed
AElfClient client = new AElfClient("http://127.0.0.1:1235");
```

GetChainStatus

Get the current status of the block chain.

Web API path

/api/blockChain/chainStatus

Parameters

Empty

Returns

ChainStatusDto

- ChainId string
- Branches Dictionary<string,long>
- NotLinkedBlocks Dictionary<string, string>
- LongestChainHeight long
- LongestChainHash string
- GenesisBlockHash string
- GenesisContractAddress string
- LastIrreversibleBlockHash string
- LastIrreversibleBlockHeight long
- BestChainHash string
- BestChainHeight long

Example

```
await client.GetChainStatusAsync();
```

GetContractFileDescriptorSet

Get the protobuf definitions related to a contract.

Web API path

/api/blockChain/contractFileDescriptorSet

Parameters

1. contractAddress - string address of a contract

Returns

byte[]

Example

```
await client.GetContractFileDescriptorSetAsync(address);
```

GetBlockHeight

Get current best height of the chain.

Web API path

/api/blockChain/blockHeight

Parameters

Empty

Returns

long

Example

```
await client.GetBlockHeightAsync();
```

GetBlock

Get block information by block hash.

Web API path

/api/blockChain/block

Parameters

- 1. blockHash string
- 2. includeTransactions bool:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

BlockDto

- BlockHash string
- Header BlockHeaderDto
 - PreviousBlockHash string
 - MerkleTreeRootOfTransactions string
 - MerkleTreeRootOfWorldState string
 - Extra string
 - Height long
 - Time DateTime
 - ChainId string
 - Bloom string
 - SignerPubkey string
- Body BlockBodyDto
 - TransactionsCount int
 - Transactions List<string>

```
await client.GetBlockByHashAsync(blockHash);
```

GetBlockByHeight

Web API path

/api/blockChain/blockByHeight

Get block information by block height.

Parameters

- 1. blockHeight long
- 2. includeTransactions bool:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

BlockDto

- BlockHash string
- Header BlockHeaderDto
 - PreviousBlockHash string
 - MerkleTreeRootOfTransactions string
 - MerkleTreeRootOfWorldState string
 - Extra string
 - Height long
 - Time DateTime
 - ChainId string
 - Bloom string
 - SignerPubkey string
- Body BlockBodyDto
 - TransactionsCount int
 - Transactions List<string>

Example

```
await client.GetBlockByHeightAsync(height);
```

GetTransactionResult

Get the result of a transaction

Web API path

/api/blockChain/transactionResult

Parameters

1. transactionId - string

```
TransactionResultDto
```

- TransactionId string
- Status string
- Logs LogEventDto[]
 - Address string
 - Name string
 - Indexed string[]
 - NonIndexed string
- Bloom string
- BlockNumber long
- Transaction TransactionDto
 - From string
 - To string
 - RefBlockNumber long
 - RefBlockPrefix string
 - MethodName string
 - Params string
 - Signature string
- Error string

Example

await client.GetTransactionResultAsync(transactionId);

GetTransactionResults

Get multiple transaction results in a block.

Web API path

/api/blockChain/transactionResults

Parameters

- 1. blockHash string
- 2. offset int
- 3. limit int

Returns

List<TransactionResultDto> - The array of transaction result:

• the transaction result object

await client.GetTransactionResultsAsync(blockHash, 0, 10);

GetTransactionPoolStatus

Get the transaction pool status.

Web API path

/api/blockChain/transactionPoolStatus

Parameters

Empty

Returns

TransactionPoolStatusOutput

- Queued int
- Validated int

Example

await client.GetTransactionPoolStatusAsync();

SendTransaction

Broadcast a transaction.

Web API path

/api/blockChain/sendTransaction

POST

Parameters

SendTransactionInput - Serialization of data into protobuf data:

• RawTransaction - string:

Returns

SendTransactionOutput

• TransactionId - string

Example

await client.SendTransactionAsync(input);

SendRawTransaction

Broadcast a transaction.

Web API path

/api/blockChain/sendTransaction

POST

Parameters

SendRawTransactionInput - Serialization of data into protobuf data:

- Transaction string
- Signature string
- ReturnTransaction bool

Returns

SendRawTransactionOutput

- TransactionId string
- Transaction TransactionDto

Example

```
await client.SendRawTransactionAsync(input);
```

SendTransactions

Broadcast multiple transactions.

Web API path

/api/blockChain/sendTransactions

POST

Parameters

SendTransactionsInput - Serialization of data into protobuf data:

• RawTransactions - string

Returns

string[]

Example

```
await client.SendTransactionsAsync(input);
```

CreateRawTransaction

Creates an unsigned serialized transaction.

Web API path

/api/blockChain/rawTransaction

POST

Parameters

CreateRawTransactionInput

- From string
- To string
- RefBlockNumber long

- RefBlockHash string
- MethodName string
- Params string

CreateRawTransactionOutput- Serialization of data into protobuf data:

• RawTransactions - string

Example

await client.CreateRawTransactionAsync(input);

ExecuteTransaction

Call a read-only method on a contract.

Web API path

/api/blockChain/executeTransaction

POST

Parameters

ExecuteTransactionDto - Serialization of data into protobuf data:

• RawTransaction - string

Returns

string

Example

await client.ExecuteTransactionAsync(input);

ExecuteRawTransaction

Call a read-only method on a contract.

Web API path

/api/blockChain/executeRawTransaction

POST

Parameters

ExecuteRawTransactionDto - Serialization of data into protobuf data:

- RawTransaction string
- Signature string

Returns

string

await client.ExecuteRawTransactionAsync(input);

GetPeers

Get peer info about the connected network nodes.

Web API path

/api/net/peers

Parameters

1. withMetrics - bool

Returns

List<PeerDto>

- IpAddress string
- ProtocolVersion int
- ConnectionTime long
- ConnectionStatus string
- Inbound bool
- BufferedTransactionsCount int
- BufferedBlocksCount int
- BufferedAnnouncementsCount int
- RequestMetrics List<RequestMetric>
 - RoundTripTime long
 - MethodName string
 - Info string
 - RequestTime string

Example

```
await client.GetPeersAsync(false);
```

AddPeer

Attempts to add a node to the connected network nodes.

Web API path

/api/net/peer

POST

Parameters

1. ipAddress - string

bool

Example

```
await client.AddPeerAsync("127.0.0.1:7001");
```

RemovePeer

Attempts to remove a node from the connected network nodes.

Web API path

/api/net/peer

DELETE

Parameters

1. ipAddress - string

Returns

bool

Example

```
await client.RemovePeerAsync("127.0.0.1:7001");
```

GetNetworkInfo

Get the network information of the node.

Web API path

/api/net/networkInfo

Parameters

Empty

Returns

NetworkInfoOutput

- Version string
- ProtocolVersion int
- Connections int

```
await client.GetNetworkInfoAsync();
```

18.2.5 AEIf Client

IsConnected

Verify whether this sdk successfully connects the chain.

Parameters

Empty

Returns

bool

Example

```
await client.IsConnectedAsync();
```

GetGenesisContractAddress

Get the address of genesis contract.

Parameters

Empty

Returns

string

Example

```
await client.GetGenesisContractAddressAsync();
```

GetContractAddressByName

Get address of a contract by given contractNameHash.

Parameters

```
1. contractNameHash - Hash
```

Returns

Address

Example

```
await client.GetContractAddressByNameAsync(contractNameHash);
```

GenerateTransaction

Build a transaction from the input parameters.

Parameters

```
1. from - string
```

```
2. to - string
```

```
3. methodName - string
```

```
4. input - IMessage
```

Transaction

Example

```
await client.GenerateTransactionAsync(from, to, methodName, input);
```

GetFormattedAddress

Convert the Address to the displayed stringsymbol_base58-string_base58-string_base58-string.

Parameters

```
1. address - Address
```

Returns

string

Example

```
await client.GetFormattedAddressAsync(address);
```

SignTransaction

Sign a transaction using private key.

Parameters

```
1. privateKeyHex - string
```

```
2. transaction - Transaction
```

Returns

Transaction

Example

```
client.SignTransaction(privateKeyHex, transaction);
```

GetAddressFromPubKey

Get the account address through the public key.

Parameters

```
    pubKey - string
```

Returns

string

client.GetAddressFromPubKey(pubKey);

GetAddressFromPrivateKey

Get the account address through the private key.

Parameters

```
1. privateKeyHex - string
```

Returns

string

Example

client.GetAddressFromPrivateKey(privateKeyHex);

GenerateKeyPairInfo

Generate a new account key pair.

Parameters

Empty

Returns

KeyPairInfo

- PrivateKey string
- PublicKey string
- Address string

Example

client.GenerateKeyPairInfo();

18.2.6 Supports

.NET Standard 2.0

18.3 aelf-sdk.go - AELF Go API

This Go library helps in the communication with an AEIf node. You can find out more here.

18.3.1 Introduction

aelf-sdk.go is a collection of libraries which allow you to interact with a local or remote aelf node, using a HTTP connection.

The following documentation will guide you through installing and running aelf-sdk.go, as well as providing a API reference documentation with examples.

If you need more information you can check out the repo: aelf-sdk.go

18.3.2 Adding aelf-sdk.go package

First you need to get aelf-sdk.go:

```
> go get -u github.com/AElfProject/aelf-sdk.go
```

18.3.3 Examples

Create instance

Create a new instance of AElfClient, and set url of an AElf chain node.

Initiate a transfer transaction

```
// Get token contract address.
tokenContractAddress, _ := aelf.GetContractAddressByName("AElf.ContractNames.Token")
fromAddress := aelf.GetAddressFromPrivateKey(aelf.PrivateKey)
methodName := "Transfer"
toAddress, _ := util.Base58StringToAddress(
→ "7s4XoUHfPuqoZAwnTV7pHWZAaivMiL8aZrDSnY9brE1woa8vz")
params := &pb.TransferInput{
       To:
              toAddress,
        Symbol: "ELF",
       Amount: 1000000000,
       Memo: "transfer in demo",
paramsByte, _ := proto.Marshal(params)
// Generate a transfer transaction.
transaction, _ := aelf.CreateTransaction(fromAddress, tokenContractAddress, _
→methodName, paramsByte)
signature, _ := aelf.SignTransaction(aelf.PrivateKey, transaction)
transaction.Signature = signature
// Send the transfer transaction to AElf chain node.
transactionByets, _ := proto.Marshal(transaction)
sendResult, _ := aelf.SendTransaction(hex.EncodeToString(transactionByets))
time.Sleep(time.Duration(4) * time.Second)
transactionResult, _ := aelf.GetTransactionResult(sendResult.TransactionID)
fmt.Println(transactionResult)
```

(continues on next page)

(continued from previous page)

```
// Query account balance.
ownerAddress, _ := util.Base58StringToAddress(fromAddress)
getBalanceInput := &pb.GetBalanceInput{
        Symbol: "ELF",
        Owner: ownerAddress,
getBalanceInputByte, _ := proto.Marshal(getBalanceInput)
getBalanceTransaction, _ := aelf.CreateTransaction(fromAddress, tokenContractAddress,
→ "GetBalance", getBalanceInputByte)
getBalanceTransaction.Params = getBalanceInputByte
getBalanceSignature, _ := aelf.SignTransaction(aelf.PrivateKey, getBalanceTransaction)
getBalanceTransaction.Signature = getBalanceSignature
getBalanceTransactionByets, _ := proto.Marshal(getBalanceTransaction)
getBalanceResult, _ := aelf.ExecuteTransaction(hex.
→EncodeToString(getBalanceTransactionByets))
balance := &pb.GetBalanceOutput{}
getBalanceResultBytes, _ := hex.DecodeString(getBalanceResult)
proto.Unmarshal(getBalanceResultBytes, balance)
fmt.Println(balance)
```

18.3.4 Web API

You can see how the Web Api of the node works in {chainAddress}/swagger/index.html tip: for an example, my local address: 'http://127.0.0.1:1235/swagger/index.html'

The usage of these methods is based on the AElfClient instance, so if you don't have one please create it:

GetChainStatus

Get the current status of the block chain.

Web API path

/api/blockChain/chainStatus

Parameters

Empty

Returns

ChainStatusDto

• ChainId - string

- Branches map[string]interface{}
- NotLinkedBlocks map[string]interface{}
- LongestChainHeight int64
- LongestChainHash string
- GenesisBlockHash string
- GenesisContractAddress string
- LastIrreversibleBlockHash string
- LastIrreversibleBlockHeight int64
- BestChainHash string
- BestChainHeight int64

Example

```
chainStatus, err := aelf.GetChainStatus()
```

GetContractFileDescriptorSet

Get the protobuf definitions related to a contract.

Web API path

/api/blockChain/contractFileDescriptorSet

Parameters

1. contractAddress - string address of a contract

Returns

byte[]

Example

GetBlockHeight

Get current best height of the chain.

Web API path

/api/blockChain/blockHeight

Parameters

Empty

Returns

float64

```
height, err := aelf.GetBlockHeight()
```

GetBlock

Get block information by block hash.

Web API path

/api/blockChain/block

Parameters

- 1. blockHash string
- 2. includeTransactions bool:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

BlockDto

- BlockHash string
- Header BlockHeaderDto
 - PreviousBlockHash string
 - MerkleTreeRootOfTransactions string
 - MerkleTreeRootOfWorldState string
 - Extra string
 - Height int64
 - Time string
 - ChainId string
 - Bloom string
 - SignerPubkey string
- Body BlockBodyDto
 - TransactionsCount int
 - Transactions []string

Example

```
block, err := aelf.GetBlockByHash(blockHash, true)
```

GetBlockByHeight

Web API path

/api/blockChain/blockByHeight

Get block information by block height.

Parameters

- 1. blockHeight int64
- 2. includeTransactions bool:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

BlockDto

- BlockHash string
- Header BlockHeaderDto
 - PreviousBlockHash string
 - MerkleTreeRootOfTransactions string
 - MerkleTreeRootOfWorldState string
 - Extra string
 - Height int64
 - Time string
 - ChainId string
 - Bloom string
 - SignerPubkey string
- Body BlockBodyDto
 - TransactionsCount int
 - Transactions []string

Example

```
block, err := aelf.GetBlockByHeight(100, true)
```

GetTransactionResult

Get the result of a transaction.

Web API path

/api/blockChain/transactionResult

Parameters

1. transactionId - string

Returns

TransactionResultDto

- TransactionId string
- Status string
- Logs []LogEventDto
 - Address string

```
- Name - string
```

- Indexed []string
- NonIndexed string
- Bloom string
- BlockNumber int64
- BlockHash string
- Transaction TransactionDto
 - From string
 - To string
 - RefBlockNumber int64
 - RefBlockPrefix string
 - MethodName string
 - Params string
 - Signature string
- ReturnValue string
- Error string

Example

transactionResult, err := aelf.GetTransactionResult(transactionID)

GetTransactionResults

Get multiple transaction results in a block.

Web API path

/api/blockChain/transactionResults

Parameters

- 1. blockHash string
- 2. offset int
- 3. limit int

Returns

- []TransactionResultDto The array of transaction result:
 - the transaction result object

Example

transactionResults, err := aelf.GetTransactionResults(blockHash, 0, 10)

GetTransactionPoolStatus

Get the transaction pool status.

Web API path

/api/blockChain/transactionPoolStatus

Parameters

Empty

Returns

TransactionPoolStatusOutput

- Queued int
- Validated int

Example

poolStatus, err := aelf.GetTransactionPoolStatus()

SendTransaction

Broadcast a transaction.

Web API path

/api/blockChain/sendTransaction

POST

Parameters

SendTransactionInput - Serialization of data into protobuf data:

• RawTransaction - string

Returns

SendTransactionOutput

• TransactionId - string

Example

sendResult, err := aelf.SendTransaction(input)

SendRawTransaction

Broadcast a transaction.

Web API path

/api/blockChain/sendTransaction

POST

Parameters

SendRawTransactionInput - Serialization of data into protobuf data:

• Transaction - string

- Signature string
- ReturnTransaction bool

SendRawTransactionOutput

- TransactionId string
- Transaction TransactionDto

Example

```
sendRawResult, err := aelf.SendRawTransaction(input)
```

SendTransactions

Broadcast multiple transactions.

Web API path

/api/blockChain/sendTransactions

POST

Parameters

rawTransactions - string - Serialization of data into protobuf data:

Returns

[]interface{}

Example

```
results, err := aelf.SendTransactions(transactions)
```

CreateRawTransaction

Creates an unsigned serialized transaction.

Web API path

/api/blockChain/rawTransaction

POST

Parameters

CreateRawTransactionInput

- From string
- To string
- RefBlockNumber int64
- RefBlockHash string
- MethodName string
- Params string

CreateRawTransactionOutput- Serialization of data into protobuf data:

• RawTransactions - string

Example

```
result, err := aelf.CreateRawTransaction(input)
```

ExecuteTransaction

Call a read-only method on a contract.

Web API path

/api/blockChain/executeTransaction

POST

Parameters

rawTransaction - string

Returns

string

Example

executeresult, err := aelf.ExecuteTransaction(rawTransaction)

ExecuteRawTransaction

Call a read-only method on a contract.

Web API path

/api/blockChain/executeRawTransaction

POST

Parameters

ExecuteRawTransactionDto - Serialization of data into protobuf data:

- RawTransaction string
- Signature string

Returns

string

Example

executeRawresult, err := aelf.ExecuteRawTransaction(executeRawinput)

GetPeers

Get peer info about the connected network nodes.

Web API path

```
/api/net/peers
```

Parameters

1. withMetrics - bool

Returns

[]PeerDto

- IpAddress string
- ProtocolVersion int
- ConnectionTime int64
- ConnectionStatus string
- Inbound bool
- BufferedTransactionsCount int
- BufferedBlocksCount int
- BufferedAnnouncementsCount int
- RequestMetrics []RequestMetric
 - RoundTripTime int64
 - MethodName string
 - Info string
 - RequestTime string

Example

```
peers, err := aelf.GetPeers(false);
```

AddPeer

Attempts to add a node to the connected network nodes.

Web API path

/api/net/peer

POST

Parameters

1. ipAddress - string

Returns

bool

```
addResult, err := aelf.AddPeer("127.0.0.1:7001");
```

RemovePeer

Attempts to remove a node from the connected network nodes.

Web API path

/api/net/peer

DELETE

Parameters

1. ipAddress - string

Returns

bool

Example

```
removeResult, err := aelf.RemovePeer("127.0.0.1:7001");
```

GetNetworkInfo

Get the network information of the node.

Web API path

/api/net/networkInfo

Parameters

Empty

Returns

NetworkInfoOutput

- Version string
- ProtocolVersion int
- Connections int

Example

```
networkInfo, err := aelf.GetNetworkInfo()
```

18.3.5 AEIf Client

IsConnected

Verify whether this sdk successfully connects the chain.

Parameters

Empty

Returns

bool

Example

```
isConnected := aelf.IsConnected()
```

GetGenesisContractAddress

Get the address of genesis contract.

Parameters

Empty

Returns

string

Example

```
contractAddress, err := aelf.GetGenesisContractAddress()
```

GetContractAddressByName

Get address of a contract by given contractNameHash.

Parameters

```
1. contractNameHash - string
```

Returns

Address

Example

```
contractAddress, err := aelf.GetContractAddressByName("AElf.ContractNames.Token")
```

CreateTransaction

Build a transaction from the input parameters.

Parameters

```
1. from - string
```

```
2. to - string
```

- 3. methodName string
- 4. params []byte

Returns

Transaction

```
transaction, err := aelf.CreateTransaction(fromAddress, toAddress, methodName, param)
```

GetFormattedAddress

Convert the Address to the displayed stringsymbol_base58-string_base58-string-chain-id.

Parameters

```
1. address - string
Returns
```

string

Example

```
formattedAddress, err := aelf.GetFormattedAddress(address);
```

SignTransaction

Sign a transaction using private key.

Parameters

```
    privateKey - string
    transaction - Transaction
```

Returns

[]byte

Example

```
signature, err := aelf.SignTransaction(privateKey, transaction)
```

GetAddressFromPubKey

Get the account address through the public key.

Parameters

```
    pubKey - string
```

Returns

string

Example

```
address := aelf.GetAddressFromPubKey(pubKey);
```

GetAddressFromPrivateKey

Get the account address through the private key.

Parameters

```
1. privateKey - string
```

string

Example

address := aelf.GetAddressFromPrivateKey(privateKey)

GenerateKeyPairInfo

Generate a new account key pair.

Parameters

Empty

Returns

KeyPairInfo

- PrivateKey string
- PublicKey string
- Address string

Example

keyPair := aelf.GenerateKeyPairInfo()

18.3.6 Supports

Go 1.13

18.4 aelf-sdk.java - AELF Java API

This Java library helps in the communication with an AEIf node. You can find out more here.

18.4.1 Introduction

aelf-sdk.java is a collection of libraries which allow you to interact with a local or remote aelf node, using a HTTP connection.

The following documentation will guide you through installing and running aelf-sdk.java, as well as providing a API reference documentation with examples.

If you need more information you can check out the repo: aelf-sdk.java

18.4.2 Adding aelf-sdk.java package

First you need to get elf-sdk.java package into your project: MvnRepository

Maven:

18.4.3 Examples

Create instance

Create a new instance of AElfClient, and set url of an AElf chain node.

```
using AElf.Client.Service;

// create a new instance of AElf, change the URL if needed
AElfClient client = new AElfClient("http://127.0.0.1:1235");
```

Test connection

Check that the AElf chain node is connectable.

```
boolean isConnected = client.isConnected();
```

Initiate a transfer transaction

```
// Get token contract address.
String tokenContractAddress = client.getContractAddressByName(privateKey, Sha256.
→getBytesSha256("AElf.ContractNames.Token"));
Client.Address.Builder to = Client.Address.newBuilder();
to.setValue(ByteString.copyFrom(Base58.decodeChecked(
→ "7s4XoUHfPuqoZAwnTV7pHWZAaivMiL8aZrDSnY9brE1woa8vz")));
Client.Address toObj = to.build();
TokenContract.TransferInput.Builder paramTransfer = TokenContract.TransferInput.
→newBuilder();
paramTransfer.setTo(toObj);
paramTransfer.setSymbol("ELF");
paramTransfer.setAmount(100000000);
paramTransfer.setMemo("transfer in demo");
TokenContract.TransferInput paramTransferObj = paramTransfer.build();
String ownerAddress = client.getAddressFromPrivateKey(privateKey);
Transaction.Builder transactionTransfer = client.generateTransaction(ownerAddress,_
→tokenContractAddress, "Transfer", paramTransferObj.toByteArray());
Transaction transactionTransferObj = transactionTransfer.build();
transactionTransfer.setSignature(ByteString.copyFrom(ByteArrayHelper.
→hexToByteArray(client.signTransaction(privateKey, transactionTransferObj))));
transactionTransferObj = transactionTransfer.build();
```

(continues on next page)

(continued from previous page)

```
// Send the transfer transaction to AElf chain node.
SendTransactionInput sendTransactionInputObj = new SendTransactionInput();
sendTransactionInputObj.setRawTransaction(Hex.toHexString(transactionTransferObj.
→toByteArray());
SendTransactionOutput sendResult = client.sendTransaction(sendTransactionInputObj);
Thread.sleep (4000);
// After the transaction is mined, query the execution results.
TransactionResultDto transactionResult = client.getTransactionResult(sendResult.
→getTransactionId());
System.out.println(transactionResult.getStatus());
// Query account balance.
Client.Address.Builder owner = Client.Address.newBuilder();
owner.setValue(ByteString.copyFrom(Base58.decodeChecked(ownerAddress)));
Client.Address ownerObj = owner.build();
TokenContract.GetBalanceInput.Builder paramGetBalance = TokenContract.GetBalanceInput.
→newBuilder();
paramGetBalance.setSymbol("ELF");
paramGetBalance.setOwner(ownerObj);
TokenContract.GetBalanceInput paramGetBalanceObj = paramGetBalance.build();
Transaction.Builder transactionGetBalance = client.generateTransaction(ownerAddress,_
→tokenContractAddress, "GetBalance", paramGetBalanceObj.toByteArray());
Transaction transactionGetBalanceObj = transactionGetBalance.build();
String signature = client.signTransaction(privateKey, transactionGetBalanceObj);
transactionGetBalance.setSignature(ByteString.copyFrom(ByteArrayHelper.
→hexToByteArray(signature)));
transactionGetBalanceObj = transactionGetBalance.build();
ExecuteTransactionDto executeTransactionDto = new ExecuteTransactionDto();
executeTransactionDto.setRawTransaction(Hex.toHexString(transactionGetBalanceObj.
→toByteArray());
String transactionGetBalanceResult = client.executeTransaction(executeTransactionDto);
TokenContract.GetBalanceOutput balance = TokenContract.GetBalanceOutput.
→getDefaultInstance().parseFrom(ByteArrayHelper.
→hexToByteArray(transactionGetBalanceResult));
System.out.println(balance.getBalance());
```

18.4.4 Web API

You can see how the Web Api of the node works in {chainAddress}/swagger/index.html tip: for an example, my local address: 'http://127.0.0.1:1235/swagger/index.html'

The usage of these methods is based on the AElfClient instance, so if you don't have one please create it:

```
using AElf.Client.Service;

// create a new instance of AElf, change the URL if needed
AElfClient client = new AElfClient("http://127.0.0.1:1235");
```

GetChainStatus

Get the current status of the block chain.

Web API path

/api/blockChain/chainStatus

Parameters

Empty

Returns

ChainStatusDto

- ChainId String
- Branches HashMap<String, Long>
- NotLinkedBlocks ashMap<String, String>
- LongestChainHeight long
- LongestChainHash String
- GenesisBlockHash String
- GenesisContractAddress String
- LastIrreversibleBlockHash String
- LastIrreversibleBlockHeight long
- BestChainHash String
- BestChainHeight long

Example

```
client.getChainStatus();
```

GetContractFileDescriptorSet

Get the protobuf definitions related to a contract.

Web API path

/api/blockChain/contractFileDescriptorSet

Parameters

1. contractAddress - String address of a contract

Returns

byte[]

```
client.getContractFileDescriptorSet(address);
```

GetBlockHeight

Get current best height of the chain.

Web API path

/api/blockChain/blockHeight

Parameters

Empty

Returns

long

Example

```
client.getBlockHeight();
```

GetBlock

Get block information by block hash.

Web API path

/api/blockChain/block

Parameters

- 1. blockHash String
- 2. includeTransactions boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

BlockDto

- BlockHash String
- Header BlockHeaderDto
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra String
 - Height long
 - Time Date
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body BlockBodyDto
 - TransactionsCount int

- Transactions - List<String>

Example

```
client.getBlockByHash(blockHash);
```

GetBlockByHeight

Web API path

/api/blockChain/blockByHeight

Get block information by block height.

Parameters

- 1. blockHeight long
- 2. includeTransactions boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

BlockDto

- BlockHash String
- Header BlockHeaderDto
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra String
 - Height long
 - Time Date
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body BlockBodyDto
 - TransactionsCount int
 - Transactions List<String>

```
client.getBlockByHeight(height);
```

GetTransactionResult

Get the result of a transaction.

Web API path

/api/blockChain/transactionResult

Parameters

1. transactionId - String

Returns

TransactionResultDto

- TransactionId String
- Status String
- Logs ist<LogEventDto>
 - Address String
 - Name String
 - Indexed List<String>
 - NonIndexed String
- Bloom String
- BlockNumber long
- Transaction TransactionDto
 - From String
 - To String
 - RefBlockNumber long
 - RefBlockPrefix String
 - MethodName String
 - Params String
 - Signature String
- Error String

Example

client.getTransactionResult(transactionId);

GetTransactionResults

Get multiple transaction results in a block.

Web API path

/api/blockChain/transactionResults

Parameters

1. blockHash - String

```
2. offset - int
```

```
3. limit - int
```

List<TransactionResultDto> - The array of transaction result:

• the transaction result object

Example

```
client.getTransactionResults(blockHash, 0, 10);
```

GetTransactionPoolStatus

Get the transaction pool status.

Web API path

/api/blockChain/transactionPoolStatus

Parameters

Empty

Returns

TransactionPoolStatusOutput

- Queued int
- Validated int

Example

```
client.getTransactionPoolStatus();
```

SendTransaction

Broadcast a transaction.

Web API path

/api/blockChain/sendTransaction

POST

Parameters

SendTransactionInput - Serialization of data into protobuf data:

• RawTransaction - String

Returns

SendTransactionOutput

• TransactionId - String

```
client.sendTransaction(input);
```

SendRawTransaction

Broadcast a transaction.

Web API path

/api/blockChain/sendTransaction

POST

Parameters

SendRawTransactionInput - Serialization of data into protobuf data:

- Transaction String
- Signature String
- ReturnTransaction boolean

Returns

SendRawTransactionOutput

- TransactionId String
- Transaction TransactionDto

Example

client.sendRawTransaction(input);

SendTransactions

Broadcast multiple transactions.

Web API path

/api/blockChain/sendTransactions

POST

Parameters

SendTransactionsInput - Serialization of data into protobuf data:

• RawTransactions - String

Returns

List<String>

Example

client.sendTransactions(input);

CreateRawTransaction

Creates an unsigned serialized transaction.

Web API path

/api/blockChain/rawTransaction

POST

Parameters

CreateRawTransactionInput

- From String
- To String
- RefBlockNumber long
- RefBlockHash String
- MethodName String
- Params String

Returns

CreateRawTransactionOutput- Serialization of data into protobuf data:

• RawTransaction - String

Example

```
client.createRawTransaction(input);
```

ExecuteTransaction

Call a read-only method on a contract.

Web API path

/api/blockChain/executeTransaction

POST

Parameters

ExecuteTransactionDto - Serialization of data into protobuf data:

• RawTransaction - String

Returns

String

Example

```
client.executeTransaction(input);
```

ExecuteRawTransaction

Call a read-only method on a contract.

Web API path

/api/blockChain/executeRawTransaction

POST

Parameters

ExecuteRawTransactionDto - Serialization of data into protobuf data:

• RawTransaction - String

• Signature - String

Returns

String

Example

```
client.executeRawTransaction(input);
```

GetPeers

Get peer info about the connected network nodes.

Web API path

```
/api/net/peers
```

Parameters

```
1. withMetrics - boolean
```

Returns

List<PeerDto>

- IpAddress String
- ProtocolVersion int
- ConnectionTime long
- ConnectionStatus String
- Inbound boolean
- BufferedTransactionsCount int
- BufferedBlocksCount int
- BufferedAnnouncementsCount int
- RequestMetrics List<RequestMetric>
 - RoundTripTime long
 - MethodName String
 - Info String
 - RequestTime String

Example

```
{\tt client.getPeers}\,({\tt false})\,;
```

AddPeer

Attempts to add a node to the connected network nodes.

Web API path

```
/api/net/peer
```

POST

Parameters

AddPeerInput

• Address - String

Returns

boolean

Example

```
client.addPeer("127.0.0.1:7001");
```

RemovePeer

Attempts to remove a node from the connected network nodes.

Web API path

/api/net/peer

DELETE

Parameters

1. address - String

Returns

boolean

Example

```
client.removePeer("127.0.0.1:7001");
```

GetNetworkInfo

Get the network information of the node.

Web API path

/api/net/networkInfo

Parameters

Empty

Returns

NetworkInfoOutput

- Version String
- ProtocolVersion int
- Connections int

```
client.getNetworkInfo();
```

18.4.5 AEIf Client

IsConnected

Verify whether this sdk successfully connects the chain.

Parameters

Empty

Returns

boolean

Example

```
client.isConnected();
```

GetGenesisContractAddress

Get the address of genesis contract.

Parameters

Empty

Returns

String

Example

```
client.getGenesisContractAddress();
```

GetContractAddressByName

Get address of a contract by given contractNameHash.

Parameters

```
    privateKey - String
    contractNameHash - byte[]
```

Returns

String

Example

```
client.getContractAddressByName(privateKey, contractNameHash);
```

GenerateTransaction

Build a transaction from the input parameters.

Parameters

```
1. from - String
```

```
2. to - String
```

3. methodName - String

4. input - byte[]

Returns

Transaction

Example

```
client.generateTransaction(from, to, methodName, input);
```

GetFormattedAddress

Convert the Address to the displayed stringsymbol_base58-string_base58-String-chain-id.

Parameters

```
1. privateKey - String
```

```
2. address - String
```

Returns

String

Example

```
client.getFormattedAddress(privateKey, address);
```

SignTransaction

Sign a transaction using private key.

Parameters

```
1. privateKeyHex - String
```

```
2. transaction - Transaction
```

Returns

String

Example

```
client.signTransaction(privateKeyHex, transaction);
```

GetAddressFromPubKey

Get the account address through the public key.

Parameters

```
    pubKey - String
```

Returns

String

Example

client.getAddressFromPubKey(pubKey);

GetAddressFromPrivateKey

Get the account address through the private key.

Parameters

```
1. privateKey - String
```

Returns

String

Example

```
client.getAddressFromPrivateKey(privateKey);
```

GenerateKeyPairInfo

Generate a new account key pair.

Parameters

Empty

Returns

KeyPairInfo

- PrivateKey String
- PublicKey String
- Address String

Example

```
client.generateKeyPairInfo();
```

18.4.6 Supports

- JDK1.8+
- Log4j2.6.2

18.5 aelf-sdk.php - AELF PHP API

18.5.1 Introduction

aelf-sdk.php for aelf is like web.js for ethereum.

aelf-sdk.php is a collection of libraries which allow you to interact with a local or remote aelf node, using a HTTP connection.

The following documentation will guide you through installing and running aelf-sdk.php, as well as providing a API reference documentation with examples.

If you need more information you can check out the repo: aelf-sdk.php)

18.5.2 Adding AEIf php SDK

In order to install this library via composer run the following command in the console:

```
$ composer require aelf/aelf-sdk dev-dev
```

composer require curl/curl

If you directly clone the sdk You must install composer and execute it in the root directory

```
"aelf/aelf-sdk": "dev-dev"
```

18.5.3 Examples

You can also see full examples in ./test;

1.Create instance

Create a new instance of AEIf, connect to an AELF chain node. Using this instance, you can call the APIs on AEIf.

```
require_once 'vendor/autoload.php';
use AElf\AElf;
$url = '127.0.0.1:8000';
$aelf = new AElf($url);
```

2.Get a system contract address

Get a system contract address, take AElf.ContractNames.Token as an example

```
require_once 'vendor/autoload.php';
use AElf\AElf;
$url = '127.0.0.1:8000';
$aelf = new AElf($url);

$privateKey = 'cd86ab6347d8e52bbbe8532141fc59ce596268143a308dld40fedf385528b458';
$bytes = new Hash();
$bytes->setValue(hex2bin(hash('sha256', 'AElf.ContractNames.Token')));
$contractAddress = $aelf->GetContractAddressByName($privateKey, $bytes);
```

3.Send a transaction

Get the contract address, and then send the transaction.

```
require_once 'vendor/autoload.php';
use AElf\AElf;
\$url = '127.0.0.1:8000';
// create a new instance of AElf
$aelf = new AElf($url);
// private key
$privateKey = 'cd86ab6347d8e52bbbe8532141fc59ce596268143a308d1d40fedf385528b458';
$aelfEcdsa = new BitcoinECDSA();
$aelfEcdsa->setPrivateKey($privateKey);
$publicKey = $aelfEcdsa->getUncompressedPubKey();
$address = $aelfEcdsa->hash256(hex2bin($publicKey));
$address = $address . substr($aelfEcdsa->hash256(hex2bin($address)), 0, 8);
// sender address
$base58Address = $aelfEcdsa->base58_encode($address);
// transaction input
$params = new Hash();
$params->setValue(hex2bin(hash('sha256', 'AElf.ContractNames.Vote')));
// transaction method name
$methodName = "GetContractAddressByName";
// transaction contract address
$toAddress = $aelf->getGenesisContractAddress();
// generate a transaction
$transactionObj = aelf->generateTransaction($base58Address, $toAddress, $methodName,
→$params);
//signature
$signature = $aelf->signTransaction($privateKey, $transactionObj);
$transactionObj->setSignature(hex2bin($signature));
// obj Dto
$executeTransactionDtoObj = ['RawTransaction' => bin2hex($transaction->
→serializeToString())];
$result = $aelf->sendTransaction($executeTransactionDtoObj);
print_r($result);
```

18.5.4 Web API

You can see how the Web Api of the node works in {chainAddress}/swagger/index.html tip: for an example, my local address: 'http://127.0.0.1:1235/swagger/index.html'

The usage of these methods is based on the AEIf instance, so if you don't have one please create it:

```
require_once 'vendor/autoload.php';
use AElf\AElf;
$url = '127.0.0.1:8000';
// create a new instance of AElf
$aelf = new AElf($url);
```

1.getChainStatus

Get the current status of the block chain.

Web API path

/api/blockChain/chainStatus

Parameters

Empty

Returns

Array

- ChainId String
- Branches Array
- NotLinkedBlocks Array
- LongestChainHeight Integer
- LongestChainHash String
- GenesisBlockHash String
- GenesisContractAddress String
- LastIrreversibleBlockHash String
- LastIrreversibleBlockHeight Integer
- BestChainHash String
- BestChainHeight Integer

Example

```
// create a new instance of AElf
$aelf = new AElf($url);

$chainStatus = $aelf->getChainStatus();
print_r($chainStatus);
```

2.getBlockHeight

Get current best height of the chain.

Web API path

/api/blockChain/blockHeight

Parameters

Empty

Returns

Integer

```
$aelf = new AElf($url);

$height = $aelfClient->GetBlockHeight();
print($height);
```

3.getBlock

Get block information by block hash.

Web API path

/api/blockChain/block

Parameters

- 1. block_hash String
- 2. include_transactions Boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

Array

- BlockHash String
- Header Array
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra List
 - Height Integer
 - Time String
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body Array
 - TransactionsCount Integer
 - Transactions Array
 - * transactionId String

```
$aelf = new AElf($url);

$block = $aelf->getBlockByHeight(1, true);
$block2 = $aelf->getBlockByHash($block['BlockHash'], false);
print_r($block2);
```

4.getBlockByHeight

Web API path

/api/blockChain/blockByHeight

Get block information by block height.

Parameters

- 1. block_height Number
- 2. include_transactions Boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

Array

- BlockHash String
- Header Array
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra List
 - Height Integer
 - Time String
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body Array
 - TransactionsCount Integer
 - Transactions Array
 - * transactionId String

Example

```
$aelf = new AElf($url);

$block = $aelf->getBlockByHeight(1, true);
print_r($block);
```

5.getTransactionResult

Get the result of a transaction

Web API path

/api/blockChain/transactionResult

Parameters

1. transactionId - String

Returns

Object

- TransactionId String
- Status String
- Logs Array
 - Address String
 - Name String
 - Indexed Array
 - NonIndexed String
- Bloom String
- BlockNumber Integer
- Transaction Array
 - From String
 - To String
 - RefBlockNumber Integer
 - RefBlockPrefix String
 - MethodName String
 - Params json
 - Signature String
- ReadableReturnValue String
- Error String

Example

```
$aelf = new AElf($url);

$block = $aelf->getBlockByHeight(1, true);
$transactionResult = $aelf->getTransactionResult($block['Body']['Transactions'][0]);
print_r('# get_transaction_result');
print_r($transactionResult);
```

6.getTransactionResults

Get multiple transaction results in a block

Web API path

/api/blockChain/transactionResults

Parameters

1. blockHash - String

```
    offset - Number
    limit - Number
```

Returns

List - The array of method descriptions:

• the transaction result object

Example

```
$aelf = new AElf($url);

$block = $aelf->getBlockByHeight(1, true);
$transactionResults = $aelf->getTransactionResults($block['Body']);
print_r($transactionResults);
```

7.getTransactionPoolStatus

Get the transaction pool status.

Web API path

/api/blockChain/transactionPoolStatus

Example

```
$aelf = new AElf($url);

$status = $aelf->getTransactionPoolStatus();
print_r($status);
```

8.sendTransaction

Broadcast a transaction

Web API path

/api/blockChain/sendTransaction

POST

Parameters

transaction - String - Serialization of data into String

9.sendTransactions

Broadcast multiple transactions

Web API path

/api/blockChain/sendTransaction

POST

Parameters

transactions - String - Serialization of data into String

Example

10.getPeers

Get peer info about the connected network nodes

Web API path

/api/net/peers

Example

```
$aelf = new AElf($url);
print_r($aelf->getPeers(true));
```

11.addPeer

Attempts to add a node to the connected network nodes

```
Web API path
```

/api/net/peer

POST

Parameters

peer_address - String - peer's endpoint

```
$aelf = new AElf($url);
$aelf->addPeer($url);
```

12.removePeer

Attempts to remove a node from the connected network nodes

Web API path

```
/api/net/peer?address=
```

POST

Parameters

```
peer_address - String - peer's endpoint
```

Example

```
$aelf = new AElf($url);
$aelf->removePeer($url);
```

13.createRawTransaction

create a raw transaction

Web API path

/api/blockchain/rawTransaction

POST

Parameters

1. transaction - Array

Returns

Array

• RawTransaction - hex string bytes generated by transaction information

Example

```
$aelf = new AElf($url);

$status = $aelf->getChainStatus();

$params = base64_encode(hex2bin(hash('sha256', 'AElf.ContractNames.Consensus')));

$param = array('value' => $params);

$transaction = [
    "from" => $aelf->getAddressFromPrivateKey($privateKey),
    "to" => $aelf->getGenesisContractAddress(),
    "refBlockNumber" => $status['BestChainHeight'],
    "refBlockHash" => $status['BestChainHash'],
    "methodName" => "GetContractAddressByName",
    "params" => json_encode($param)
];
```

(continues on next page)

(continued from previous page)

```
$rawTransaction = $aelf->createRawTransaction($transaction);
print_r($rawTransaction);
```

14.sendRawTransaction

send raw transactions

Web API path

/api/blockchain/sendRawTransaction

Parameters

- 1. Transaction raw transaction
- 2. Signature signature
- 3. ReturnTransaction indicates whether to return transaction

Example

```
$aelf = new AElf($url);

$rawTransaction = $aelf->createRawTransaction($transaction);

$transactionId = hash('sha256', hex2bin($rawTransaction['RawTransaction']));

$sign = $aelf->getSignatureWithPrivateKey($privateKey, $transactionId);

$transaction = array('Transaction' => $rawTransaction['RawTransaction'], 'signature']

$\iff => $sign, 'returnTransaction' => true);

$execute = $aelf->sendRawTransaction($transaction);

print_r($execute);
```

15.executeRawTransaction

execute raw transactions

Web API path

/api/blockchain/executeRawTransaction

Post

Parameters

- 1. RawTransaction raw transaction
- 2. Signature signature

16.getMerklePathByTransactionId

get merkle path

Web API path

/api/blockchain/merklePathByTransactionId?transactionId=

Parameters

1. transactionId - String

Example

```
$aelf = new AElf($url);

$block = $aelf->getBlockByHeight(1, true);
$merklePath = $aelf->getMerklePathByTransactionId($block['Body']['Transactions'][0]);
```

17.getNetworkInfo

get network information

Web API path

/api/net/networkInfo

Example

```
$aelf = new AElf($url);
print_r($aelf->getNetworkInfo());
```

18.getContractFileDescriptorSet

get contract file descriptor set

Web API path

/api/blockChain/contractFileDescriptorSet

Example

```
$aelf = new AElf($url);

$blockDto = $aelf->getBlockByHeight($blockHeight, false);
$transactionResultDtoList = $aelf->getTransactionResults($blockDto['BlockHash'], 0, 0);

foreach ($transactionResultDtoList as $v) {
   $request = $aelf->getContractFileDescriptorSet($v['Transaction']['To']);
   print_r($request);
}
```

19.getTaskQueueStatus

get task queue status

Web API path

/api/blockChain/taskQueueStatus

Example

```
$aelf = new AElf($url);

$taskQueueStatus = $aelf->getTaskQueueStatus();
print_r($taskQueueStatus);
```

20.executeTransaction

execute transaction

Web API path

Post

/api/blockChain/executeTransaction

Example

```
$aelf = new AElf($url);

$methodName = "GetNativeTokenInfo";
$bytes = new Hash();
$bytes->setValue(hex2bin(hash('sha256', 'AElf.ContractNames.Token')));
$toAddress = $aelf->GetContractAddressByName($privateKey, $bytes);
$param = new Hash();
$param->setValue('');
$transaction = $aelf->generateTransaction($fromAddress, $toAddress, $methodName, $param);
$signature = $aelf->signTransaction($privateKey, $transaction);
$transaction->setSignature(hex2bin($signature));
$executeTransactionDtoObj = ['RawTransaction' => bin2hex($transaction-> serializeToString())];
$response = $aelf->executeTransaction($executeTransactionDtoObj);
$tokenInfo = new TokenInfo();
$tokenInfo->mergeFromString(hex2bin($response));
```

18.5.5 Other Tool Kit

AEIf supply some APIs to simplify developing.

1.getChainId

get chain id

```
$aelf = new AElf($url);
$chainId = $aelf->getChainId();
print_r($chainId);
```

2.generateTransaction

generate a transaction object

```
$aelf = new AElf($url);

$param = new Hash();

$param->setValue('');

$transaction = $aelf->generateTransaction($fromAddress, $toAddress, $methodName,

$\to$param);
```

3.signTransaction

sign a transaction

4.getGenesisContractAddress

get the genesis contract's address

```
$aelf = new AElf($url);

$genesisContractAddress = $aelf->getGenesisContractAddress();
print_r($genesisContractAddress);
```

4.getAddressFromPubKey

calculate the account address accoriding to the public key

```
$aelf = new AElf($url);

$pubKeyAddress = $aelf->getAddressFromPubKey(
        '04166cf4be901dee1c21f3d97b9e4818f229bec72a5ecd56b5c4d6ce7abfc3c87e25c36fd279db721acf4258fb489b4a4
        ');
print_r($pubKeyAddress);
```

5.getFormattedAddress

convert the Address to the displayed stringsymbol_base58-string_base58-string-chain-id.

```
$aelf = new AElf($url);
$addressVal = $aelf->getFormattedAddress($privateKey, $base58Address);
print_r($addressVal);
```

6.generateKeyPairInfo

generate a new key pair using ECDSA

```
$aelf = new AElf($url);

$pairInfo = $aelf->generateKeyPairInfo();
print_r($pairInfo);
```

7.getContractAddressByName

get contract's address from its name

```
$aelf = new AElf($url);

$bytes = new Hash();

$bytes->setValue(hex2bin(hash('sha256', 'AElf.ContractNames.Token')));

$contractAddress = $aelf->GetContractAddressByName($privateKey, $bytes);

print_r($contractAddress);
```

8.getAddressFromPrivateKey

get address from a private key

```
$aelf = new AElf($url);

$address = $aelf->getAddressFromPrivateKey($privateKey);
print_r($address);
```

9.getSignatureWithPrivateKey

given a private key, get the signature

```
$aelf = new AElf($url);
$sign = $aelf->getSignatureWithPrivateKey($privateKey, $transactionId);
print_r($sign);
```

10.isConnected

check if it connects the chain

```
$aelf = new AElf($url);
$isConnected = $this->aelf->isConnected();
print_r($isConnected);
```

11.getTransactionFees

get the transaction fee from transaction result

```
$aelf = new AElf($url);

$block = $aelf->getBlockByHeight(1, true);
$transactionResult = $aelf->getTransactionResult($block['Body']['Transactions'][0]);
$transactionFees = $aelf->getTransactionFees($transactionResult);
print_r($transactionFees);
```

18.5.6 AEIf.version

```
$aelf = new AElf($url);
$version = $aelf->version;
```

18.5.7 Requirements

• php

18.5.8 About contributing

Read out [contributing guide]

18.5.9 About Version

https://semver.org/

18.6 aelf-sdk.py - AELF Python API

18.6.1 Introduction

aelf-sdk.py for aelf is like web.js for ethereum.

aelf-sdk.py is a collection of libraries which allow you to interact with a local or remote aelf node, using a HTTP connection.

The following documentation will guide you through installing and running aelf-sdk.py, as well as providing a API reference documentation with examples.

If you need more information you can check out the repo: aelf-sdk.py

18.6.2 Adding aelf-sdk.js

First you need to get aelf-sdk package into your project. This can be done using the following methods:

```
pip: pip install aelf-sdk
```

After that you need to create a aelf instance by a node's URL.

```
chain = AElf('http://127.0.0.1:8000')
```

18.6.3 Examples

You can also see full examples in ./test;

1.Create instance

Create a new instance of AEIf, connect to an AELF chain node. Using this instance, you can call the APIs on AEIf.

```
from aelf import AElf

// create a new instance of AElf
aelf = AElf('http://127.0.0.1:8000')
```

2.Get a system contract address

Get a system contract address, take AElf.ContractNames.Token as an example

3.Send a transaction

Get the contract address, and then send the transaction.

(continues on next page)

(continued from previous page)

```
// execute the transaction
aelf.execute_transaction(transaction)
```

18.6.4 Web API

You can see how the Web Api of the node works in {chainAddress}/swagger/index.html tip: for an example, my local address: 'http://127.0.0.1:1235/swagger/index.html'

The usage of these methods is based on the AEIf instance, so if you don't have one please create it:

```
from aelf import AElf

// create a new instance of AElf, change the URL if needed
aelf = AElf('http://127.0.0.1:8000')
```

1.get_chain_status

Get the current status of the block chain.

Web API path

/api/blockChain/chainStatus

Parameters

Empty

Returns

json

- ChainId String
- Branches json
- NotLinkedBlocks json
- LongestChainHeight Number
- LongestChainHash String
- GenesisBlockHash String
- GenesisContractAddress String
- LastIrreversibleBlockHash String
- LastIrreversibleBlockHeight Number
- BestChainHash String
- BestChainHeight Number

```
aelf = AElf(url)
chain_status = aelf.get_chain_status()
print('# get_chain_status', chain_status)
```

2.get_block_height

Get current best height of the chain.

Web API path

/api/blockChain/blockHeight

Parameters

Empty

Returns

Number

Example

```
aelf = AElf(url)
block_height = aelf.get_block_height()
print('# get_block_height', block_height)
```

3.get_block

Get block information by block hash.

Web API path

/api/blockChain/block

Parameters

- 1. block_hash String
- 2. include_transactions Boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

json

- BlockHash String
- Header json
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra List
 - Height Number
 - Time json
 - ChainId String
 - Bloom String
 - SignerPubkey String

- Body json
 - TransactionsCount Number
 - Transactions List
 - * transactionId String

Example

```
aelf = AElf(url)
block = aelf.get_block(blockHash)
print('# get_block', block)
```

4.get_block_by_height

Web API path

/api/blockChain/blockByHeight

Get block information by block height.

Parameters

- 1. block_height Number
- 2. include_transactions Boolean:
- true require transaction ids list in the block
- false Doesn't require transaction ids list in the block

Returns

json

- BlockHash String
- Header json
 - PreviousBlockHash String
 - MerkleTreeRootOfTransactions String
 - MerkleTreeRootOfWorldState String
 - Extra List
 - Height Number
 - Time json
 - ChainId String
 - Bloom String
 - SignerPubkey String
- Body json
 - TransactionsCount Number
 - Transactions List
 - * transactionId String

Example

234

```
aelf = AElf(url)
block_by_height = aelf.get_block_by_height(12, false)
print('# get_block_by_height', block_by_height)
```

5.get_transaction_result

Get the result of a transaction

Web API path

/api/blockChain/transactionResult

Parameters

1. transactionId - String

Returns

json

- TransactionId String
- Status String
- Logs List
 - Address String
 - Name String
 - Indexed List
 - NonIndexed String
- Bloom String
- BlockNumber Number
- Transaction List
 - From String
 - To String
 - RefBlockNumber Number
 - RefBlockPrefix String
 - MethodName String
 - Params json
 - Signature String
- ReadableReturnValue json
- Error String

```
aelf = AElf(url)

transaction_result = aelf.get_transaction_result(transactionId)
print('# get_transaction_results', transaction_result)
```

6.get transaction results

Get multiple transaction results in a block

Web API path

/api/blockChain/transactionResults

Parameters

- 1. blockHash String
- 2. offset Number
- 3. limit Number

Returns

List - The array of method descriptions:

• the transaction result object

Example

```
aelf = AElf(url)
transaction_results = aelf.get_transaction_results(blockHash, 0, 2)
print('# get_transaction_results', transaction_results)
```

7.get_transaction_pool_status

Get the transaction pool status.

Web API path

/api/blockChain/transactionPoolStatus

Example

```
aelf = AElf(url)

tx_pool_status = aelf.get_transaction_pool_status()
print('# get_transaction_pool_status', tx_pool_status)
```

8.send_transaction

Broadcast a transaction

Web API path

/api/blockChain/sendTransaction

POST

Parameters

transaction - String - Serialization of data into String

9.send transactions

Broadcast multiple transactions

Web API path

/api/blockChain/sendTransaction

POST

Parameters

transactions - String - Serialization of data into String

Example

```
aelf = AElf(url)
current_height = aelf.get_block_height()
block = aelf.get_block_by_height(current_height, include_transactions=False)
transaction1 = Transaction().SerializePartialToString().hex()
transaction2 = Transaction().SerializePartialToString().hex()
result = aelf.send_transaction(transaction1 + ',' + transaction2)
print('# send_transactions', result)
```

10.get_peers

Get peer info about the connected network nodes

Web API path

/api/net/peers

Example

```
aelf = AElf(url)
peers = aelf.get_peers()
print('# get_peers', peers)
```

11.add_peer

Attempts to add a node to the connected network nodes

Web API path

/api/net/peer

POST

Parameters

peer_address - String - peer's endpoint

Example

```
aelf = AElf(url)
add_peer = aelf.add_peer(endpoint)
print('# add_peers', add_peer)
```

12.remove_peer

Attempts to remove a node from the connected network nodes

Web API path

/api/net/peer?address=

POST

Parameters

peer_address - String - peer's endpoint

Example

```
aelf = AElf(url)

remove_peer = aelf.remove_peer(address)
print('# remove_peer', remove_peer)
```

13.create_raw_transaction

create a raw transaction

Web API path

/api/blockchain/rawTransaction

POST

Parameters

1. transaction - the json format transaction

Returns

json

• RawTransaction - hex string bytes generated by transaction information

```
aelf = AElf(url)

transaction = {
    "From": aelf.get_address_string_from_public_key(public_key),
    "To": aelf.get_system_contract_address_string("AElf.ContractNames.Consensus"),
    "RefBlockNumber": 0,
    "RefBlockHash": "b344570eb80043d7c5ae9800c813b8842660898bf03cbd41e583b4e54af4e7fa

.",
    "MethodName": "GetCurrentMinerList",
    "Params": '{}'
}

raw_transaction = aelf.create_raw_transaction(transaction)
```

14.send_raw_transaction

send raw transactions

Web API path

/api/blockchain/sendRawTransaction

Parameters

- 1. Transaction raw transaction
- 2. Signature signature
- 3. ReturnTransaction indicates whether to return transaction

Example

```
aelf = AElf(url)

raw_transaction = aelf.create_raw_transaction(transaction)
signature = private_key.sign_recoverable(bytes.fromhex(raw_transaction['RawTransaction
→']))
transaction_2 = {
    "Transaction": raw_transaction['RawTransaction'],
    'Signature': signature.hex(),
    'ReturnTransaction': True
}
print('# send_raw_transaction', aelf.send_raw_transaction(transaction_2))
```

15.execute_raw_transaction

execute raw transactions

Web API path

/api/blockchain/executeRawTransaction

Post

Parameters

- 1. RawTransaction raw transaction
- 2. Signature signature

```
aelf = AElf(url)

raw_transaction = aelf.create_raw_transaction(transaction)
signature = private_key.sign_recoverable(bytes.fromhex(raw_transaction['RawTransaction
→']))
transaction_1 = {
    "RawTransaction": raw_transaction['RawTransaction'],
    "Signature": signature.hex()
}
print('# execute_raw_transaction', aelf.execute_raw_transaction(transaction_1))
```

16.get_merkle_path

get merkle path

Web API path

/api/blockchain/merklePathByTransactionId?transactionId=

Parameters

1. transactionId - String

Example

```
aelf = AElf(url)

transaction_results = aelf.get_transaction_results(transactionId)
print('# get_transaction_results', transaction_results)
```

17.get_network_info

get network information

Web API path

/api/net/networkInfo

Example

```
aelf = AElf(url)
print('# get_network_info', aelf.get_network_info())
```

18.6.5 AEIf.client

Use the api to see detailed results

1.get_genesis_contract_address_string

Returns

String: zero contract address

```
aelf = AElf(url)
genesis_contract_address = aelf.get_genesis_contract_address_string()
```

2.get_system_contract_address

Parameters

1. contract_name - String: system Contract's name

Returns

Address: system Contract's address

Example

3.get_system_contract_address_string

Parameters

1. contract_name - String: system Contract's name

Returns

String: system Contract's address

Example

4.create transaction

create a transaction

Parameters

- $1. \ \, \text{to_address} \ \ \, \text{Address} \ \, \text{or String: target contract's address}$
- 2. method_name String: method name
- 3. params String: serilize paramters into String

5.sign transaction

sign transaction with user's private key

Parameters

- 1. private_key String: user's private key
- 2. transaction Transaction: transaction

Example_

6.get_address_from_public_key

generate address from public key

Parameters

```
1. public_key - bytes: user's public key
```

Returns

Address

Example_

```
aelf = AElf(url)
address = aelf.get_address_from_public_key(public_key)
```

7.get_address_string_from_public_key

generate address string from public key

Parameters

```
1. public_key - bytes: user's public key
```

Returns

String

```
aelf = AElf(url)
address = aelf.get_address_string_from_public_key(public_key)
```

8.get_chain_id

get chain id

Returns

Number

Example_

```
aelf = AElf(url)
chain_id = aelf.get_chain_id()
print('# get_chain_id', chain_id)
```

9.get formatted address

get formatted address

Parameters

1. address Address: address

Returns

String

Example_

```
aelf = AElf(url)
address = aelf.chain.get_system_contract_address("AElf.ContractNames.Consensus")
formatted_address = aelf.get_formatted_address(address)
print('formatted_address', formatted_address)
```

10.is_connected

check whether to connect the node

Example_

```
aelf = AElf(url)
is_connected = aelf.is_connected()
```

18.6.6 Tookkits.py

AElfToolkit Encapsulate AElf and user's private key. It simplifies the procedures of sending some transactions. You can find it in src/aelf/toolkits.py.

Create a toolKit

Create a toolKit with AElfToolkit.

Send a transaction

Send a CrossChainTransfer transaction

```
from aelf import AElfToolkit

// generate the private key
private_key_string = 'b344570eb80043d7c5ae9800c813b8842660898bf03cbd41e583b4e54af4e7fa

---'
private_key = PrivateKey(bytes(bytearray.fromhex(private_key_string)))

// create input, the type is generated by protoc
cross_chain_transfer_input = CrossChainTransferInput()

// AElfToolkit simplifies this transcation execution.

// create a toolKit
toolkit = AElfToolkit('http://127.0.0.1:8000', private_key)
toolkit.cross_chain_transfer(to_address_string, symbol, amount, memo, to_chain_id)
```

18.6.7 Requirements

- python
- docker

18.6.8 Support

BoolState type

Namespace

A Elf. Sdk. CSharp. State

Summary

Wrapper around boolean values for use in smart contract state.

BytesState type

Namespace

AElf.Sdk.CSharp.State

Summary

Wrapper around byte arrays for use in smart contract state.

CSharpSmartContractContext type

Namespace

AElf.Sdk.CSharp

Summary

Represents the transaction execution context in a smart contract. An instance of this class is present in the base class for smart contracts (Context property). It provides access to properties and methods useful for implementing the logic in smart contracts.

ChainId property

Summary

The chain id of the chain on which the contract is currently running.

CurrentBlockTime property

Summary

The time included in the current blocks header.

CurrentHeight property

Summary

The height of the block that contains the transaction currently executing.

Origin property

Summary

The address of the sender (signer) of the transaction being executed. It's type is an AEIf address. It corresponds to the From field of the transaction. This value never changes, even for nested inline calls. This means that when you access this property in your contract, it's value will be the entity that created the transaction (user or smart contract through an inline call).

Previous Block Hash property

Summary

The hash of the block that precedes the current in the blockchain structure.

Self property

Summary

The address of the contract currently being executed. This changes for every transaction and inline transaction.

Sender property **Summary** The Sender of the transaction that is executing. StateProvider property **Summary** Provides access to the underlying state provider. TransactionId property **Summary** The ID of the transaction that's currently executing. Variables property Summary Provides access to variable of the bridge. Transaction property **Summary** Including some transaction info. Call(fromAddress,toAddress,methodName,args) method **Summary** Calls a method on another contract. **Returns** The result of the call.

Name	Туре	Description
fromAddress	AElf.Types.Address	The address to use as sender.
toAddress	AElf.Types.Address	The address of the contract you're seeking to interact with.
methodName	System.String	The name of method you want to call.
args	Google.Protobuf.Byte\$tffhg input arguments for calling that method. This is usually gener-	
		ated from the protobuf
definition of the in-		
put type		

Generic Types

Name	Description
T	The type of the return message.

ConvertHashToInt64(hash,start,end) method

Summary

Converts the input hash to a 64-bit signed integer.

Returns

The 64-bit signed integer.

Parameters

Name	Туре	Description
hash	AElf.Types.Has	h The hash.
start	System.Int64	The inclusive lower bound of the number returned.
end	System.Int64	The exclusive upper bound of the number returned. endValue must be greater than or
		equal to startValue.

Exceptions

Name	Description	
System.ArgumentEx	eption startValue is less than 0 or greater than endValu	e.

$\textbf{ConvertVirtualAddressToContractAddress} (\textbf{virtualAddress}) \ \texttt{method}$

Summary

Converts a virtual address to a contract address.

Returns

The converted address.

Parameters

Name	Туре	Description
virtualAddress	AElf.Types.Hash	The virtual address that want to convert.

$\textbf{ConvertVirtualAddressToContractAddress} (virtualAddress, contractAddress) \ \texttt{method}$

Summary

Converts a virtual address to a contract address with the contract address.

Returns

The converted address.

Parameters

Name	Туре	Description
virtualAddress	AElf.Types.Hash	The virtual address that want to convert.
contractAddress	AElf.Types.Address	The contract address.

ConvertVirtualAddressToContractAddressWithContractHashName(

virtualAddress) method

Summary

Converts a virtual address to a contract address with the current contract hash name.

Returns

The converted address.

Name	Туре	Description
virtualAddress	AElf.Types.Hash	The virtual address that want to convert.

ConvertVirtualAddressToContractAddressWithContractHashName(

virtualAddress,contractAddress) method

Summary

Converts a virtual address to a contract address with the contract hash name.

Returns

Parameters

Name	Туре	Description
virtualAddress	AElf.Types.Hash	The virtual address that want to convert.
contractAddress	AElf.Types.Address	The contract address.

DeployContract(address,registration,name) method

Summary

Deploy a new smart contract (only the genesis contract can call it).

Parameters

Name	Туре	Description
address	AElf.Types.Address	The address of new smart contract.
registration	AElf.Types.SmartContractRegistration	The registration of the new smart contract.
name	AElf.Types.Hash	The hash value of the smart contract name.

FireLogEvent(logEvent) method

Summary

This method is used to produce logs that can be found in the transaction result after execution.

Name	Type	Description
logEvent	AElf.Types.LogEvent	The event to fire.

GenerateId(contractAddress,bytes) method

Summary

Generate a hash type id based on the contract address and the bytes.

Returns

The generated hash type id.

Parameters

Name	Туре		Description
contractAd-	AElf.Types.Address		The contract address on which the id generation
dress			is based.
bytes	System.Collections.	Generic.IEnumerable	The bytes on which the id generation is based.
	{System.Byte}		

GetContractAddressByName(hash) method

Summary

It's sometimes useful to get the address of a system contract. The input is a hash of the system contracts name. These hashes are easily accessible through the constants in the SmartContractConstants.cs file of the C# SDK.

Returns

The address of the system contract.

Parameters

Name	Type	Description
hash	AElf.Types.Hash	The hash of the name.

GetPreviousBlockTransactions() method

Summary

Returns the transaction included in the previous block (previous to the one currently executing).

A list of transaction.

Parameters

This method has no parameters.

GetRandomHash(fromHash) method

Summary

Gets a random hash based on the input hash.

Returns

Random hash.

Parameters

Name	Туре	Description
fromHash	AElf.Types.Hash	Hash.

${\bf GetSystemContractNameToAddressMapping()}\ {\tt method}$

Summary

Get the mapping that associates the system contract addresses and their name's hash.

Returns

The addresses with their hashes.

Parameters

This method has no parameters.

GetZeroSmartContractAddress() method

Summary

This method returns the address of the Genesis contract (smart contract zero) of the current chain.

The address of the genesis contract.

Parameters

This method has no parameters.

GetZeroSmartContractAddress(chainId) method

Summary

This method returns the address of the Genesis contract (smart contract zero) of the specified chain.

Returns

The address of the genesis contract, for the given chain.

Parameters

Name	Туре	Description
chainId	System.Int32	The chain's ID.

LogDebug(func) method

Summary

Application logging - when writing a contract it is useful to be able to log some elements in the applications log file to simplify development. Note that these logs are only visible when the node executing the transaction is build in debug mode.

Parameters

Name	Туре	Description	
func	System.Func {System.String}	The logic that will be executed for logging purposes.	1

RecoverPublicKey() method

Summary

Recovers the public key of the transaction Sender.

A byte array representing the public key.

Parameters

This method has no parameters.

${\bf SendInline} (to {\bf Address}, method {\bf Name}, args) \ {\tt method}$

Summary

Sends an inline transaction to another contract.

Parameters

Name	Туре	Description
toAddress	AElf.Types. Address	The address of the contract you're seeking to interact with.
methodName	System.String	The name of method you want to invoke.
args	Google.Protobuf	The input arguments for calling that method. This is usually gen-
	.ByteString	erated from the protobuf
definition of the in-		
put type.		

$Send Virtual In line (from Virtual Address, to Address, method Name, args) \ {\tt method}$

Summary

Sends a virtual inline transaction to another contract.

Parameters

Name	Туре	Description
fromVirtualAddress	AElf.Types.Hash	The virtual address to use as sender.
toAddress	AElf.Types. Address	The address of the contract you're seeking to interact with.
methodName	System.String	The name of method you want to invoke.
args	Google.Protobuf	The input arguments for calling that method. This is usually gen-
	.ByteString	erated from the protobuf
definition of the in-		
put type.		

Send Virtual In line By System Contract (from Virtual Address, to Address, t

methodName,args) method

Summary

Like SendVirtualInline but the virtual address us a system smart contract.

Parameters

Name	Туре	Description
fromVirtualAd-	AElf.Types.Hash	Sends a virtual inline transaction to another contract. This method is
dress		only available to system smart contract.
toAddress	AElf.Types. Ad-	The address of the contract you're seeking to interact with.
	dress	
methodName	System.String	The name of method you want to invoke.
args	Google.Protobuf	The input arguments for calling that method. This is usually generated
	.ByteString	from the protobuf
definition of the		
input type.		

UpdateContract(address,registration,name) method

Summary

Update a smart contract (only the genesis contract can call it).

Parameters

Name	Туре	Description
address	AElf.Types.Address	The address of smart contract to update.
registration	AElf.Types.SmartContractRegistration	The registration of the smart contract to update.
name	AElf.Types.Hash <#T-AElf-Types-Hash>	The hash value of the smart contract name to update.

ValidateStateSize(obj) method

Summary

Verify that the state size is within the valid value.

Returns

The state.

Parameters

Name	Туре	Description
obj	System.Object	The state.

Exceptions

Name	Description
AElf.Kernel.SmartContract.StateOverSizeException	The state size exceeds the limit.

VerifySignature(tx) method

Summary

Returns whether or not the given transaction is well formed and the signature is correct.

Returns

The verification results.

Parameters

Name	Type	Description
tx	AElf.Types.Transaction	The transaction to verify.

CSharpSmartContract type

Namespace

AElf.Sdk.CSharp

Summary

This class represents a base class for contracts written in the C# language. The generated code from the protobuf definitions will inherit from this class.

Generic Types

Name	Description
TContractState	

Context property

Summary

Represents the transaction execution context in a smart contract. It provides access inside the contract to properties and methods useful for implementing the smart contracts action logic.

State property

Summary

Provides access to the State class instance. TContractState is the type of the state class defined by the contract author.

ContractState type

Namespace

AElf.Sdk.CSharp.State

Summary

Base class for the state class in smart contracts.

Int32State type

Namespace

AElf.Sdk.CSharp.State

Summary

Wrapper around 32-bit integer values for use in smart contract state.

Int64State type

Namespace

AElf.Sdk.CSharp.State

Summary

Wrapper around 64-bit integer values for use in smart contract state.

MappedState type

Namespace

AElf.Sdk.CSharp.State

Summary

Key-value pair data structure used for representing state in contracts.

Generic Types

Name	Description
TKey	The type of the key.
TEntity	The type of the value.

SingletonState type

Namespace

AElf.Sdk.CSharp.State

Summary

Represents single values of a given type, for use in smart contract state.

SmartContractBridgeContextExtensions type

Namespace

AElf.Sdk.CSharp

Summary

Extension methods that help with the interactions with the smart contract execution context.

Call(context,address,methodName,message) method

Summary

Calls a method on another contract.

Returns

The return value of the call.

Name	Type	Description
context	AElf.Kernel.SmartContract. IS-	The virtual address of the system. contract to use as
	martContractBridgeContext	sender.
address	AElf.Types. Address	The address of the contract you're seeking to interact
		with.
methodName	System.String	The name of method you want to call.
message	Google.Protobuf.ByteString	The input arguments for calling that method. This is
		usually generated from the protobuf
definition of the		
input type.		

Generic Types

Name	Description	
T	The return type of the call.	

$\pmb{Call(context, address, method Name, message)} \ \texttt{method}$

Summary

Calls a method on another contract.

Returns

The result of the call.

Parameters

Name	Туре	Description
context	AElf.Sdk.CSharp.CSharpSmartContractCon	eAn instance of ISmartContractBridgeContext
address	AElf.Types. Address	The address of the contract you're seeking to interact
		with.
method-	System.String	The name of method you want to call.
Name		
message	Google.Protobuf.ByteString	The protobuf message that will be the input to the
		call.

Generic Types

Name	Description	
T	The type of the return message.	

$\pmb{Call(context, from Address, to Address, method Name, message) \texttt{ method}}\\$

Summary

Calls a method on another contract.

Returns

The result of the call.

Parameters

Name	Туре	Description
context	AElf.Sdk.CSharp.CSharpSmartContractCon	eAn instance of ISmartContractBridgeContext
fromAd-	AElf.Types. Address	The address to use as sender.
dress		
toAd-	AElf.Types. Address	The address of the contract you're seeking to interact
dressvv		with.
method-	System.String	The name of method you want to call.
Name		
message	Google.Protobuf.ByteString	The protobuf message that will be the input to the
		call.

Generic Types

Name	Description	
T	The type of the return message.	

Call(context,address,methodName,message) method

Summary

Calls a method on another contract.

Returns

The result of the call.

Name	Туре	Description
context	AElf.Sdk.CSharp.CSharpSmartContractConte	xtAn instance of ISmartContractBridgeContext
address	AElf.Types. Address	The address to use as sender.
method-	System.String	The name of method you want to call.
Name		
message	Google.Protobuf.ByteString	The protobuf message that will be the input to the
		call.

Generic Types

Name	Description	
T	The type of the return message.	

ConvertToByteString(message) method

Summary

Serializes a protobuf message to a protobuf ByteString.

Returns

ByteString.Empty if the message is null

Parameters

Name	Type	Description
message	Google.Protobuf.IMessage	The message to serialize.

ConvertVirtualAddressToContractAddress (this, virtualAddress) ~method

Summary

Converts a virtual address to a contract address.

Returns

Name	Туре	Description
this	AElf.Kernel.SmartContract. ISmartContractBridge-	An instance of ISmartContractBridge-
	Context	Context
virtualAd-	AElf.Types.Hash Address	The virtual address that want to convert.
dress		

Convert Virtual Address To Contract Address With Contract Hash Name (this, and the contract Hash Name) and the contract Hash Name (this, and the contract Hash Name) and the contract Hash Name (this, and the contract Hash Name) and the contract Hash Name (this, and the contract Hash Name).

virtualAddress) method

Summary

Converts a virtual address to a contract address with the currently running contract address.

Returns

Parameters

Name	Туре		Description
this	AElf.Kernel.SmartContract.	ISmartContractBridge-	An instance of ISmartContractBridge-
	Context		Context
virtualAd-	AElf.Types.Hash Address		The virtual address that want to convert.
dress			

Fire(context,eventData) method

Summary

Logs an event during the execution of a transaction. The event type is defined in the AElf.CSharp.core project.

Parameters

Name	Туре	Description
context	AElf.Sdk.CSharp.CSharpSmartContractContext	An instance of ISmartContractBridgeContext
eventData		The event to log.

Generic Types

Name	Description
T	The type of the event.

GenerateId(this,bytes) method

Summary

Generate a hash type id based on the currently running contract address and the bytes.

Returns

The generated hash type id.

Parameters

Name	Type		Description
this	AElf.Kernel.SmartContract.	ISmartContractBridgeCon-	An instance of ISmartContractBridgeCon-
	text		text
bytes	System.Collections.Generic	.IEnumer-	The bytes on which the id generation is
	able{System.Byte}		based.

GenerateId(this,token) method

Summary

Generate a hash type id based on the currently running contract address and the token.

Returns

The generated hash type id.

Parameters

Name	Туре	Description
this	AEIf.Kernel.SmartContract. ISmartContractBridgeCon-	An instance of ISmartContractBridgeCon-
	text	text
token	System.String	The token on which the id generation is
		based.

GenerateId(this,token) method

Summary

Generate a hash type id based on the currently running contract address and the hash type token.

Returns

The generated hash type id.

Name	Туре	Description
this	AElf.Kernel.SmartContract. ISmartContractBridge-	An instance of ISmartContractBridgeContext
	Context	
token	AEIf.Types.Hash	The hash type token on which the id generation is
		based.

GenerateId(this) method

Summary

Generate a hash type id based on the currently running contract address.

Returns

The generated hash type id.

Parameters

Name	Type		Description
this	AElf.Kernel.SmartContract.	ISmartContractBridgeCon-	An instance of ISmartContractBridgeCon-
	text		text

GenerateId(this,address,token) method

Summary

Generate a hash type id based on the address and the bytes.

Returns

The generated hash type id.

Parameters

Name	Туре	Description
this	AElf.Kernel.SmartContract. ISmartContract-	An instance of ISmartContractBridgeContext
	BridgeContext	
ad-	AElf.Types.Address	The address on which the id generation is based.
dress		
token	AElf.Types.Hash	The hash type token on which the id generation is
		based.

SendInline(context,toAddress,methodName,message) method

Summary

Sends an inline transaction to another contract.

Parameters

Name	Туре	Description
context	AElf.Kernel.SmartContract. ISmartContract-	An instance of ISmartContractBridgeContext
	BridgeContext	
toAddress	AElf.Types.Address	The address of the contract you're seeking to in-
		teract with.
method-	System.String	The name of method you want to invoke.
Name		
message	Google.Protobuf.ByteString	The protobuf message that will be the input to
		the call.

SendInline(context,toAddress,methodName,message) method

Summary

Sends a virtual inline transaction to another contract.

Parameters

Name	Туре	Description
context	AElf.Kernel.SmartContract. ISmartContract-	An instance of ISmartContractBridgeContext
	BridgeContext	
toAddress	AElf.Types.Address	The address of the contract you're seeking to in-
		teract with.
method-	System.String	The name of method you want to invoke.
Name		
message	Google.Protobuf.ByteString	The protobuf message that will be the input to
		the call.

SendVirtualInline(context,fromVirtualAddress,toAddress,methodName,

message) method

Summary

Sends a virtual inline transaction to another contract.

Name	Туре	Description
context	AElf.Kernel.SmartContract. ISmartContract-	An instance of ISmartContractBridgeContext
	BridgeContext	
fromVirtualAd-	AElf.Types.Hash	The virtual address to use as sender.
dress		
toAddress	AElf.Types.Address	The address of the contract you're seeking to
		interact with.
methodName	System.String	The name of method you want to invoke.
message	Google.Protobuf.ByteString	The protobuf message that will be the input to
		the call.

Send Virtual In line (context, from Virtual Address, to Address, method Name, in the context of the context o

message) method

Summary

Sends a virtual inline transaction to another contract.

Parameters

Name	Type	Description
context	AElf.Kernel.SmartContract. ISmartContract-	An instance of ISmartContractBridgeContext
	BridgeContext	
fromVirtualAd-	AElf.Types.Hash	The virtual address to use as sender.
dress		
toAddress	AElf.Types.Address	The address of the contract you're seeking to
		interact with.
methodName	System.String	The name of method you want to invoke.
message	Google.Protobuf.ByteString	The protobuf message that will be the input to
		the call.

SmartContractConstants type

Namespace

AElf.Sdk.CSharp

Summary

Static class containing the hashes built from the names of the contracts.

StringState type

Namespace

AElf.Sdk.CSharp.State

Summary

Wrapper around string values for use in smart contract state.

UInt32State type

Namespace

AElf.Sdk.CSharp.State

Summary

Wrapper around unsigned 32-bit integer values for use in smart contract state.

UInt64State type

Namespace

AElf.Sdk.CSharp.State

Summary

Wrapper around unsigned 64-bit integer values for use in smart contract state.

Builder type

Namespace

AElf.CSharp.Core.ServerServiceDefinition

Summary

Builder class for ServerServiceDefinition.

ctor() constructor

Summary

Creates a new instance of builder.

Parameters

This constructor has no parameters.

AddMethod"2(method,handler) method

Summary

Adds a definition for a single request - single response method.

Returns

This builder instance.

Parameters

Name	Туре	Description
method	AElf.CSharp.Core.Method	The method.
handler	AElf.CSharp.Core.UnaryServerMethod	The method handler.

Generic Types

Name	Description
TRequest	The request message class.
TResponse	The response message class.

Build() method

Summary

Creates an immutable ServerServiceDefinition from this builder.

Returns

 $The \ {\tt ServerServiceDefinition} \ object.$

Parameters

This method has no parameters.

EncodingHelper type

Namespace

AElf.CSharp.Core.Utils

Summary

Helper class for serializing strings.

EncodeUtf8(str) method

Summary

Serializes a UTF-8 string to a byte array.

Returns

the serialized string.

Parameters

Name	Type	Description
str	System.String	

IMethod type **Namespace** AElf.CSharp.Core **Summary** A non-generic representation of a remote method. FullName property **Summary** Gets the fully qualified name of the method. On the server side, methods are dispatched based on this name. Name property **Summary** Gets the unqualified name of the method. ServiceName property **Summary** Gets the name of the service to which this method belongs. Type property **Summary** Gets the type of the method. Marshaller type

Summary

Namespace

AElf.CSharp.Core

Encapsulates the logic for serializing and deserializing messages.

ctor(serializer,deserializer) constructor

Summary

Initializes a new marshaller from simple serialize/deserialize functions.

Parameters

Name	Туре	Description
serializer	System.Func	Function that will be used to deserialize messages.

Deserializer property

Summary

Gets the deserializer function.

Serializer property

Summary

Gets the serializer function.

Marshallers type

Namespace

AElf.CSharp.Core

Summary

Utilities for creating marshallers.

StringMarshaller property

Summary

Returns a marshaller for string type. This is useful for testing.

Create() method

Summary

Creates a marshaller from specified serializer and deserializer.

This method has no parameters.

MethodType type

Namespace

AElf.CSharp.Core

Action constants

Summary

The method modifies the contrac state.

View constants

Summary

The method doesn't modify the contract state.

Method type

Namespace

AElf.CSharp.Core

Summary

A description of a remote method.

Generic Types

Name	Description
TRequest	Request message type for this method.
TResponse	Response message type for this method.

${\bf ctor} (type, service Name, name, request Marshaller, response Marshaller) \verb| constructor| \\$

Summary

Initializes a new instance of the Method class.

Name	Type	Description
type	AElf.CSharp.Core.Method	Type of method.
serviceName	System.String	Name of service this method belongs to.
name	System.String	Unqualified name of the method.
request Marshaller	AElf.CSharp.Core.Marshaller	Marshaller used for request messages.
response Marshaller	AElf.CSharp.Core.Marshaller	Marshaller used for response messages.

FullName property

Summary

Gets the fully qualified name of the method. On the server side, methods are dispatched based on this name.

Name property

Summary

Gets the unqualified name of the method.

RequestMarshaller property

Summary

Gets the marshaller used for request messages.

ResponseMarshaller property

Summary

Gets the marshaller used for response messages.

ServiceName property

Summary

Gets the name of the service to which this method belongs.

Type property

Summary

Gets the type of the method.

GetFullName() method

Summary

Gets full name of the method including the service name.

Parameters

This method has no parameters.

Preconditions type

Namespace

AElf.CSharp.Core.Utils

CheckNotNull(reference) method

Summary

Throws ArgumentNullException if reference is null.

Parameters

Name	Type	Description
reference		The reference.

CheckNotNull(reference,paramName) method

Summary

Throws ArgumentNullException if reference is null.

Parameters

Name	Type	Description
reference		The reference.
paramName	System.String	The parameter name.

SafeMath type

Namespace

AElf.CSharp.Core

Summary

Helper methods for safe math operations that explicitly check for overflow.

ServerServiceDefinition type

Namespace

AElf.CSharp.Core

Summary

Stores mapping of methods to server call handlers. Normally, the ServerServiceDefinition objects will be created by the BindService factory method that is part of the autogenerated code for a protocol buffers service definition.

BindService() method

Summary

Forwards all the previously stored AddMethod calls to the service binder.

Parameters

This method has no parameters.

CreateBuilder() method

Summary

Creates a new builder object for ServerServiceDefinition.

Returns

The builder object.

Parameters

This method has no parameters.

ServiceBinderBase type

Namespace

AElf.CSharp.Core

Summary

Allows binding server-side method implementations in alternative serving stacks. Instances of this class are usually populated by the BindService method that is part of the autogenerated code for a protocol buffers service definition.

AddMethod(method,handler) method

Summary

Adds a definition for a single request - single response method.

Parameters

Name	Туре	Description
method	AElf.CSharp.Core.Method	The method.
handler	AElf.CSharp.Core.UnaryServerMethod	The method handler.

Generic Types

Name	Description
TRequest	The request message class.
TResponse	The response message class.

TimestampExtensions type

Namespace

AElf.CSharp.Core.Extension

Summary

Helper methods for dealing with protobuf timestamps.

AddDays(timestamp,days) method

Summary

Adds a given amount of days to a timestamp. Returns a new instance.

Returns

a new timestamp instance.

Name	Туре	Description
timestamp	Google.Protobuf.WellKnown Types.Timestamp	the timestamp.
days	System. Int64	the amount of days.

AddHours(timestamp,hours) method

Summary

Adds a given amount of hours to a timestamp. Returns a new instance.

Returns

a new timestamp instance.

Parameters

Name	Туре	Description
timestamp	Google.Protobuf .WellKnownTypes.Timestamp	the timestamp.
hours	System.Int64	the amount of hours.

AddMilliseconds(timestamp, milliseconds) method

Summary

Adds a given amount of milliseconds to a timestamp. Returns a new instance.

Returns

a new timestamp instance.

Parameters

Name	Туре	Description
timestamp	Google.Protobuf. WellKnownTypes.Timestamp	the timestamp.
milliseconds	System. Int64	the amount of milliseconds to add.

AddMinutes(timestamp, minutes) method

Summary

Adds a given amount of minutes to a timestamp. Returns a new instance.

a new timestamp instance.

Parameters

Name	Туре	Description
timestamp	Google.Protobuf .WellKnownTypes.Timestamp	the timestamp.
minutes	System.Int64	the amount of minutes.

AddSeconds(timestamp,seconds) method

Summary

Adds a given amount of seconds to a timestamp. Returns a new instance.

Returns

a new timestamp instance.

Parameters

Name	Type	Description
timestamp	Google.Protobuf .WellKnownTypes.Timestam	the timestamp.
seconds	System.Int64	the amount of seconds.

Max(timestamp1,timestamp2) method

Summary

Compares two timestamps and returns the greater one.

Returns

the greater timestamp.

Parameters

Name	Туре	Description
timestamp1	Google.Protobuf .WellKnownTypes.Timestamp	the first timestamp
timestamp2	Google.Protobuf .WellKnownTypes.Timestamp	the second timestamp

Milliseconds(duration) method

Summary

Converts a protobuf duration to long.

Returns

the duration represented with a long.

Parameters

Name	Туре	Description
duration	Google.Protobuf. WellKnownTypes.Duration	the duration to convert.

UnaryServerMethod type

Namespace

AElf.CSharp.Core

Summary

Handler for a contract method.

Generic Types

Name	Description
TRequest	Request message type for this method.
TResponse	Response message type for this method.

CHAPTER 20

Smart Contract APIs

This section gives an overview of some important contracts and contract methods. It's not meant to be exhaustive. With every method description we give the parameter message in JSON format, this can be useful when using client (like **aelf-command**).

20.1 AEIf.Contracts.Association

Association contract.

Organizations established to achieve specific goals can use this contract to cooperatively handle transactions within the organization

Implement AEIf Standards ACS1 and ACS3.

20.1.1 Contract Methods

Method Name	Request Type	Response	Description
		Type	
CreateOrganization	Associa-	aelf.Address	Create an organization and return its
	tion.CreateOrganizationInput		address.
CreateOrganization-	Associa-	aelf.Address	Creates an organization by system
BySystemContract	tion.CreateOrganizationBySystem	nContractInput	contract and return its address.
AddMember	aelf.Address	google.protobuf	EAddyorganization members.
RemoveMember	aelf.Address		Exampove organization members.
ChangeMember	Associa-	google.protobuf	Examplace organization member with a
	tion.ChangeMemberInput		new member.
GetOrganization	aelf.Address	Associa-	Get the organization according to the
		tion.Organizatio	norganization address.
CalculateOrganiza-	Associa-	aelf.Address	Calculate the input and return the or-
tionAddress	tion.CreateOrganizationInput		ganization address.

AEIf.Standards.ACS1

Method Name	Request Type	Response	Description
		Type	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptive method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Exhapming the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ag Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.E	m A tvythorityInfo	Query the method fee controller.
FeeController			

AEIf.Standards.ACS3

Method	Request	Re-	Description
Name	Type	sponse	·
		Type	
CreatePro-	acs3.CreatePro	p oxedfIHpux tn	Create a proposal for which organization members can vote. When the
posal			proposal is released, a transaction will be sent to the specified contract.
			Return id of the newly created proposal.
Approve	aelf.Hash	google.pro	ptolppfrEwepayproposal according to the proposal ID.
Reject	aelf.Hash	google.pro	ot Bleige of Trappinoposal according to the proposal ID.
Abstain	aelf.Hash	google.pro	pt Albs(timptp roposal according to the proposal ID.
Release	aelf.Hash	google.pro	pt Blank: as weather proposal according to the proposal ID and send a transaction
			to the specified contract.
ChangeOr-	acs3.ProposalR	el googT da pe d	chical the property of the sholds associated with proposals. All fields will be
ganization-			overwritten by the input value and this will affect all current propos-
Threshold			als of the organization. Note: only the organization can execute this
			through a proposal.
ChangeOr-	acs3.ProposerV	Vh gitælgik t.pro	ptolhanging mutter white list of organization proposer. This method overrides
ganization-			the list of whitelisted proposers.
Proposer-			
WhiteList			
CreatePro-	acs3.CreatePro	p oxedfBHxSs hs	termeter aupthoposal by system contracts, and return id of the newly cre-
posal-			ated proposal.
BySystem-			
Contract			
ClearPro-	aelf.Hash	google.pro	pt Ream diverthe specified proposal. If the proposal is in effect, the cleanup
posal			fails.
GetProposal	aelf.Hash	acs3.Prop	o Sad Other proposal according to the proposal ID.
Validate-	aelf.Address	google.pro	pt OngCRaheVextis atence of an organization.
Organiza-			
tionExist			
Vali-	acs3.ValidatePi	o gos gd i nfW	hitelhijs Rrip like/peoposer is whitelisted.
datePro-

WhiteList			

20.1.2 Contract Types

AEIf.Contracts.Association

Association.ChangeMemberInput

Field	Туре	Description	Label
old_member	aelf.Address	The old member address.	
new_member	aelf.Address	The new member address.	

Association. Create Organization By System Contract Input

Field	Туре	Description	La-
			bel
organiza-	CreateOrgani-	The parameters of creating organization.	
tion_creation_input	zationInput		
organiza-	string	The organization address callback method which replies the	
tion_address_feedback_m	ethod	organization address to caller contract.	

Association.CreateOrganizationInput

Field	Туре	Description	La-
			bel
organiza-	OrganizationMemberList	Initial organization members.	
tion_member_list			
pro-	acs3.ProposalReleaseThresh	oll the threshold for releasing the proposal.	
posal_release_threshold			
proposer_white_list	acs3.ProposerWhiteList	The proposer whitelist.	
creation_token	aelf.Hash	The creation token is for organization address	
		generation.	

Association.MemberAdded

Field	Туре	Description	Label
member	aelf.Address	The added member address.	
organization_address	aelf.Address	The organization address.	

Association.MemberChanged

Field	Type	Description	Label
old_member	aelf.Address	The old member address.	
new_member	aelf.Address	The new member address.	
organization_address	aelf.Address	The organization address.	

Association.MemberRemoved

Field	Туре	Description	Label
member	aelf.Address	The removed member address.	
organization_address	aelf.Address	The organization address.	

Association.Organization

Field	Туре	Description	La-
			bel
organiza-	Organization Member List	The organization members.	
tion_member_list			
pro-	acs3.ProposalReleaseThresh	<i>oll</i> he threshold for releasing the proposal.	
posal_release_threshold			
proposer_white_list	acs3.ProposerWhiteList	The proposer whitelist.	
organization_address	aelf.Address	The address of organization.	
organization_hash	aelf.Hash	The organizations id.	
creation_token	aelf.Hash	The creation token is for organization address	
		generation.	

Association.OrganizationMemberList

Field	Туре	Description	Label
organization_members	aelf.Address	The address of organization members.	repeated

Association.ProposalInfo

Field	Туре	Description	Label
proposal_id	aelf.Hash	The proposal ID.	
con-	string	The method that this proposal will call when being	
tract_method_name		released.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestan	<i>p</i> The date at which this proposal will expire.	
proposer	aelf.Address	The address of the proposer of this proposal.	
organization_address	aelf.Address	The address of this proposals organization.	
approvals	aelf.Address	Address list of approved.	re-
			peated
rejections	aelf.Address	Address list of rejected.	re-
			peated
abstentions	aelf.Address	Address list of abstained.	re-
			peated
pro-	string	Url is used for proposal describing.	
posal_description_url			

AEIf.Standards.ACS1

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS3

acs 3. Create Proposal By System Contract Input

Field	Туре	Description	Label
proposal_input	CreateProposalInput	The parameters of creating proposal.	
origin_proposer	aelf.Address	The actor that trigger the call.	

acs3.CreateProposalInput

Field	Туре	Description	La- bel
con-	string	The name of the method to call after release.	
tract_method_na	me		
to_address	aelf.Address	The address of the contract to call after release.	
params	bytes	The parameter of the method to be called after the release.	
expired_time	google.protobuf.Tit	n Ashartipnestamp at which this proposal will expire.	
organiza-	aelf.Address	The address of the organization.	
tion_address			
pro-	string	Url is used for proposal describing.	
posal_description	n_url		
token	aelf.Hash	The token is for proposal id generation and with this token, proposal	
		id can be calculated before proposing.	

acs3.OrganizationCreated

Field	Туре	Description	Label
organization_address	aelf.Address	The address of the created organization.	

acs 3. Organization Hash Address Pair

Field	Type	Description	Label
organization_hash	aelf.Hash	The id of organization.	
organization_address	aelf.Address	The address of organization.	

acs 3. Organization Threshold Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address	
proposer_release_threshold	Proposal Release Threshold	The new release threshold.	

acs 3. Organization White List Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address.	
proposer_white_list	ProposerWhiteList	The new proposer whitelist.	

acs3.ProposalCreated

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the created proposal.	
organization_address	aelf.Address	The organization address of the created proposal.	

acs3.ProposalOutput

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The id of the proposal.	
con-	string	The method that this proposal will call when being re-	
tract_method_name		leased.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestam	The date at which this proposal will expire.	
organiza-	aelf.Address	The address of this proposals organization.	
tion_address			
proposer	aelf.Address	The address of the proposer of this proposal.	
to_be_released	bool	Indicates if this proposal is releasable.	
approval_count	int64	Approval count for this proposal.	
rejection_count	int64	Rejection count for this proposal.	
abstention_count	int64	Abstention count for this proposal.	

acs3.ProposalReleaseThreshold

Field	Type	Description	Label
minimal_approval_threshold	int64	The value for the minimum approval threshold.	
maximal_rejection_threshold	int64	The value for the maximal rejection threshold.	
maximal_abstention_threshold	int64	The value for the maximal abstention threshold.	
minimal_vote_threshold	int64	The value for the minimal vote threshold.	

acs3.ProposalReleased

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the released proposal.	
organization_address	aelf.Address	The organization address of the released proposal.	

acs3.ProposerWhiteList

Field	Type	Description	Label
proposers	aelf.Address	The address of the proposers	repeated

acs3.ReceiptCreated

Field	Type	Description	Label
proposal_id	aelf.Hash	The id of the proposal.	
address	aelf.Address	The sender address.	
receipt_type	string	The type of receipt(Approve, Reject or Abstain).	
time	google.protobuf.Timestamp	The timestamp of this method call.	
organization_address	aelf.Address	The address of the organization.	

acs 3. Validate Proposer In White List Input

Field	Type	Description	Label
proposer	aelf.Address	The address to search/check.	
organization_address	aelf.Address	The address of the organization.	

AEIf.Types

aelf.Address

Field	Туре	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Туре	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Туре	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Туре	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	n imm otek	erThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_na	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.

		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

AuthorityInfo

Field	Type	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address aelf.Address		The address of the owner of the contract.	

20.2 AEIf.Contracts.Referendum

Referendum contract.

Production nodes or associations cannot determine all decisions. Some extremely important decisions, especially those involving user rights and interests, should involve all users and give full control to the user's voting for governance. The Referendum contract is built for this.

Implement AEIf Standards ACS1 and ACS3.

20.2.1 Contract Methods

Method Name	Request Type	Response	Description
		Туре	
ReclaimVoteToken	aelf.Hash	google.protobuf.	Elomphyck the token used for voting ac-
			cording to proposal id.

20.2.2 Contract Types

AEIf.Contracts.Referendum

Referendum. Create Organization By System Contract Input

Field	Туре	Description	La-
			bel
organiza-	CreateOrgani-	The parameters of creating organization.	
tion_creation_input	zationInput		
organiza-	string	The organization address callback method which replies the	
tion_address_feedback_method		organization address to caller contract.	

Referendum.CreateOrganizationInput

Field	Туре	Description	La-
			bel
token_symbol	string	The token used during proposal operations.	
pro-	acs3.ProposalReleaseThresh	oll the threshold for releasing the proposal.	
posal_release_threshold			
proposer_white_list	acs3.ProposerWhiteList	The proposer whitelist.	
creation_token	aelf.Hash	The creation token is for organization address	
		generation.	

Referendum.Organization

Field	Туре	Description	La-
			bel
pro-	acs3.ProposalReleaseThresh	<i>oll</i> he threshold for releasing the proposal.	
posal_release_threshold			
token_symbol	string	The token used during proposal operations.	
organization_address	aelf.Address	The address of organization.	
organization_hash	aelf.Hash	The organizations id.	
proposer_white_list	acs3.ProposerWhiteList	The proposer whitelist.	
creation_token	aelf.Hash	The creation token is for organization address	
		generation.	

Referendum.ProposalInfo

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The proposal ID.	
con-	string	The method that this proposal will call when being	
tract_method_name		released.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestan	pThe date at which this proposal will expire.	
proposer	aelf.Address	The address of the proposer of this proposal.	
organization_address	aelf.Address	The address of this proposals organization.	
approval_count	int64	The count of approved.	
rejection_count	int64	The count of rejected.	
abstention_count	int64	The count of abstained.	
pro-	string	Url is used for proposal describing.	
posal_description_url			

Referendum.Receipt

Field	Туре	Description	Label
amount	int64	The amount of token locked.	
token_symbol	string	The symbol of token locked.	
lock_id	aelf.Hash	The lock id.	

Referendum. Referendum Receipt Created

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the proposal.	
address	aelf.Address	The sender address.	
symbol	string	The symbol of token locked.	
amount	int64	The amount of token locked.	
receipt_type	string	The type of receipt(Approve, Reject or Abstain).	
time	google.protobuf.Timestamp	The timestamp of this method call.	
organization_address	aelf.Address	The address of the organization.	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Type	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS3

acs 3. Create Proposal By System Contract Input

Field	Type	Description	Label
proposal_input	CreateProposalInput	The parameters of creating proposal.	
origin_proposer	aelf.Address	The actor that trigger the call.	

acs3.CreateProposalInput

Field	Туре	Description	La- bel
con-	string	The name of the method to call after release.	
tract_method_na	me		
to_address	aelf.Address	The address of the contract to call after release.	
params	bytes	The parameter of the method to be called after the release.	
expired_time	google.protobuf.Ti	n Ashartipnestamp at which this proposal will expire.	
organiza-	aelf.Address	The address of the organization.	
tion_address			
pro-	string	Url is used for proposal describing.	
posal_description	_url		
token	aelf.Hash	The token is for proposal id generation and with this token, proposal	
		id can be calculated before proposing.	

acs3.OrganizationCreated

Field	Туре	Description	Label
organization_address	aelf.Address	The address of the created organization.	

acs3.OrganizationHashAddressPair

Field	Type	Description	Label
organization_hash	aelf.Hash	The id of organization.	
organization_address	aelf.Address	The address of organization.	

acs 3. Organization Threshold Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address	
proposer_release_threshold	ProposalReleaseThreshold	The new release threshold.	

acs 3. Organization White List Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address.	
proposer_white_list	ProposerWhiteList	The new proposer whitelist.	

acs3.ProposalCreated

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the created proposal.	
organization_address	aelf.Address	The organization address of the created proposal.	

acs3.ProposalOutput

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The id of the proposal.	
con-	string	The method that this proposal will call when being re-	
tract_method_name		leased.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestam	p The date at which this proposal will expire.	
organiza-	aelf.Address	The address of this proposals organization.	
tion_address			
proposer	aelf.Address	The address of the proposer of this proposal.	
to_be_released	bool	Indicates if this proposal is releasable.	
approval_count	int64	Approval count for this proposal.	
rejection_count	int64	Rejection count for this proposal.	
abstention_count	int64	Abstention count for this proposal.	

acs 3. Proposal Release Threshold

Field	Type	Description	Label
minimal_approval_threshold	int64	The value for the minimum approval threshold.	
maximal_rejection_threshold	int64	The value for the maximal rejection threshold.	
maximal_abstention_threshold	int64	The value for the maximal abstention threshold.	
minimal_vote_threshold	int64	The value for the minimal vote threshold.	

acs3.ProposalReleased

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the released proposal.	
organization_address	aelf.Address	The organization address of the released proposal.	

acs 3. Proposer White List

Field	Type	Description	Label
proposers	aelf.Address	The address of the proposers	repeated

acs3.ReceiptCreated

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the proposal.	
address	aelf.Address	The sender address.	
receipt_type	string	The type of receipt(Approve, Reject or Abstain).	
time	google.protobuf.Timestamp	The timestamp of this method call.	
organization_address	aelf.Address	The address of the organization.	

acs 3. Validate Proposer In White List Input

Field	Туре	Description	Label
proposer	aelf.Address	The address to search/check.	
organization_address	aelf.Address	The address of the organization.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf. Binary Merkle Tree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed bytes The indexed da		The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La- bel
from	from Ad - The address of the sender of the transaction.		
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n <i>im163</i> 6	rThe height of the referenced block hash.	
ref_block_	plogrifiess	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Type	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hdash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IO	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.3 AEIf.Contracts.Parliament

Parliament contract.

The production nodes use the Parliament contract to govern important matters. In the initial state, the production nodes are members of the parliament, and only when two-thirds of the production nodes vote in favor of a given decision, will it be executed.

Implement AEIf Standards ACS1 and ACS3.

20.3.2 Contract Types

AEIf.Contracts.Parliament

${\bf Parliament. Create Organization By System Contract Input}$

Field	Туре	Description	La-
			bel
organiza-	CreateOrgani-	The parameters of creating organization.	
tion_creation_input	zationInput		
organiza-	string	The organization address callback method which replies the	
tion_address_feedback_m	ethod	organization address to caller contract.	

Parliament.CreateOrganizationInput

Field	Туре	Description	La-
			bel
proposal_release_threshold	acs3.ProposalReleaseTh	rësholdireshold for releasing the proposal.	
proposer_authority_required	bool	Setting this to true can allow anyone to create	
		proposals.	
parlia-	bool	Setting this to true can allow parliament member	
ment_member_proposing_allo	wed	to create proposals.	
creation_token	aelf.Hash	The creation token is for organization address	
		generation.	

Parliament.InitializeInput

Field	Туре	Description	La-
			bel
privileged_proposer	aelf.Addre	f.AddresPrivileged proposer would be the first address in parliament proposer	
		whitelist.	
pro-	bool	The setting indicates if proposals need authority to be created for	
poser_authority_requi	red	first/default parliament organization.	

Parliament.Organization

Field	Туре	Description	La- bel
proposer_authority_required	bool	Indicates if proposals need authority to be cre-	DCI
1 1 = 3= 1		ated.	
organization_address	aelf.Address	The organization address.	
organization_hash	aelf.Hash	The organization id.	
proposal_release_threshold	acs3.ProposalReleaseTh	re Whol threshold for releasing the proposal.	
parlia-	bool	Indicates if parliament member can propose to	
ment_member_proposing_allo	wed	this organization.	
creation_token	aelf.Hash	The creation token is for organization address	
		generation.	

Parliament.ProposalldList

Field	Туре	Description	Label
proposal_ids	aelf.Hash	The list of proposal ids.	repeated

Parliament.ProposalInfo

Field	Туре	Description	Label
proposal_id	aelf.Hash	The proposal ID.	
con-	string	The method that this proposal will call when being	
tract_method_name		released.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestar	<i>p</i> The date at which this proposal will expire.	
proposer	aelf.Address	The address of the proposer of this proposal.	
organization_address	aelf.Address	The address of this proposals organization.	
approvals	aelf.Address	Address list of approved.	re-
			peated
rejections	aelf.Address	Address list of rejected.	re-
			peated
abstentions	aelf.Address	Address list of abstained.	re-
			peated
pro-	string	Url is used for proposal describing.	
posal_description_url			

AEIf.Standards.ACS1

acs1.MethodFee

Field	Type	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Type	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS3

acs 3. Create Proposal By System Contract Input

Field	Туре	Description	Label
proposal_input	CreateProposalInput	The parameters of creating proposal.	
origin_proposer	aelf.Address	The actor that trigger the call.	

acs3.CreateProposalInput

Field	Туре	Description	La- bel
con-	string	The name of the method to call after release.	
tract_method_nar	ne		
to_address	aelf.Address	The address of the contract to call after release.	
params	bytes	The parameter of the method to be called after the release.	
expired_time	google.protobuf.Ti	n Ashartipnestamp at which this proposal will expire.	
organiza-	aelf.Address	The address of the organization.	
tion_address			
pro-	string	Url is used for proposal describing.	
posal_description	_url		
token	aelf.Hash	The token is for proposal id generation and with this token, proposal id can be calculated before proposing.	

acs3.OrganizationCreated

Field	Туре	Description	Label
organization_address	aelf.Address	The address of the created organization.	

acs 3. Organization Hash Address Pair

Field	Type	Description	Label
organization_hash	aelf.Hash	The id of organization.	
organization_address	aelf.Address	The address of organization.	

acs 3. Organization Threshold Changed

Field	Type	Description	Label
organization_address	aelf.Address	The organization address	
proposer_release_threshold	ProposalReleaseThreshold	The new release threshold.	

acs 3. Organization White List Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address.	
proposer_white_list	ProposerWhiteList	The new proposer whitelist.	

acs3.ProposalCreated

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the created proposal.	
organization_address	aelf.Address	The organization address of the created proposal.	

acs3.ProposalOutput

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The id of the proposal.	
con-	string	The method that this proposal will call when being re-	
tract_method_name		leased.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestam	The date at which this proposal will expire.	
organiza-	aelf.Address	The address of this proposals organization.	
tion_address			
proposer	aelf.Address	The address of the proposer of this proposal.	
to_be_released	bool	Indicates if this proposal is releasable.	
approval_count	int64	Approval count for this proposal.	
rejection_count	int64	Rejection count for this proposal.	
abstention_count	int64	Abstention count for this proposal.	

acs 3. Proposal Release Threshold

Field	Type	Description	Label
minimal_approval_threshold	int64	The value for the minimum approval threshold.	
maximal_rejection_threshold	int64	The value for the maximal rejection threshold.	
maximal_abstention_threshold	int64	The value for the maximal abstention threshold.	
minimal_vote_threshold	int64	The value for the minimal vote threshold.	

acs3.ProposalReleased

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the released proposal.	
organization_address	aelf.Address	The organization address of the released proposal.	

acs3.ProposerWhiteList

Field	Туре	Description	Label
proposers	aelf.Address	The address of the proposers	repeated

acs3.ReceiptCreated

Field	Type	Description	Label
proposal_id	aelf.Hash	The id of the proposal.	
address	aelf.Address	The sender address.	
receipt_type	string	The type of receipt(Approve, Reject or Abstain).	
time	google.protobuf.Timestamp	The timestamp of this method call.	
organization_address	aelf.Address	The address of the organization.	

acs 3. Validate Proposer In White List Input

Field	Туре	Description	Label
proposer	aelf.Address	The address to search/check.	
organization_address	aelf.Address	The address of the organization.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Туре	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description Lab	
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n imm 034	rThe height of the referenced block hash.	
ref_block_	pberties	The first four bytes of the referenced block hash.	
method_na	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture method as well as the parameter that were given. It also contains the reference be		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Type	Description	Label
key	string		
value	bool	_	

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hdash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IO	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.4 AEIf.Contracts.Consensus.AEDPoS

AEDPoS contract.

Used to managing block producers and synchronizing data.

Implement AEIf Standards ACS1, ACS4, ACS6, ACS10 and ACS11.

20.4.1 Contract Methods

Method Name	Request Type	Response Type

ingPermission			miner.

20.4.2 Contract Types

AEIf.Contracts.Consensus.AEDPoS

AEDPoS.AEIfConsensusHeaderInformation

Field	Туре	Description	Label
sender_pubkey	bytes	The sender public key.	
round	Round	The round information.	
behaviour	AElfConsensusBehaviour	The behaviour of consensus.	

AEDPoS.AEIfConsensusHint

Field	Туре	Description	Label
behaviour	AElfConsensusBehaviour	The behaviour of consensus.	
round_id	int64	The round id.	
previous_round_id	int64	The previous round id.	

AEDPoS.AEIfConsensusTriggerInformation

Field	Туре	Description	Label
pubkey	bytes	The miner public key.	
in_value	aelf.Hash	The InValue for current	
		round.	
previ-	aelf.Hash	The InValue for previous	
ous_in_value		round.	
behaviour	AElfConsensusBehaviour	The behaviour of consensus.	
en-	AElfConsensusTriggerInforma-	The encrypted pieces of In-	re-
crypted_pieces	tion.EncryptedPiecesEntry	Value.	peated
de-	AElfConsensusTriggerInforma-	The decrypted pieces of In-	re-
crypted_pieces	tion.DecryptedPiecesEntry	Value.	peated
re-	AElfConsensusTriggerInforma-	The revealed InValues.	re-
vealed_in_values	tion.RevealedInValuesEntry		peated

${\bf AEDPoS. AEIf Consensus Trigger Information. Decrypted Pieces Entry}$

Field	Туре	Description	Label
key	string		
value	bytes		

${\bf AEDPoS.AEIf Consensus Trigger Information. Encrypted Pieces Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

${\bf AEDPoS. AEIf Consensus Trigger Information. Revealed In Values Entry}$

Field	Туре	Description	Label
key	string		
value	aelf.Hash		

AEDPoS.Candidates

Field	Type	Description	Label
pubkeys	bytes	The candidate public keys.	repeated

AEDPoS.ConsensusInformation

Field	Type	Description	Label
value	bytes		

AEDPoS.GetMinerListInput

Field	Type	Description	Label
term_number	int64	The term number.	

AEDPoS.HashList

Field	Туре	Description	Label
values	aelf.Hash		repeated

AEDPoS.InitialAElfConsensusContractInput

Field	Type	Description	Label
is_term_stay_one	bool	Whether not to change the term.	
is_side_chain	bool	Is a side chain.	
period_seconds	int64	The number of seconds per term.	
miner_increase_interval	int64	The interval second that increases the number of miners.	

AEDPoS.IrreversibleBlockFound

Field	Type	Description	Label
irreversible_block_height	int64	The irreversible block height found.	

${\bf AEDPoS.} Irreversible {\bf Block Height Unacceptable}$

Field	Туре	Description	Label
distance_to_irreversible_block_height	int64	Distance to the height of the last irreversible block.	

AEDPoS.LatestPubkeyToTinyBlocksCount

Field	Туре	Description	Label
pubkey	string	The miner public key.	
blocks_count	int64	The count of blocks the miner produced.	

AEDPoS.MinerInRound

Field	Туре	Description	La- bel
order	int32	The order of the miner producing block.	
is_extra_block_produc	erbool	Is extra block producer in the current round.	
in_value	aelf.Hash	Generated by secret sharing and used for validation	
		between miner.	
out_value	aelf.Hash	Calculated from current in value.	
signature	aelf.Hash	Calculated from current in value and signatures of pre-	
		vious round.	
ex-	google.protobuf.Timestan	pThe expected mining time.	
pected_mining_time			
produced_blocks	int64	The amount of produced blocks.	
missed_time_slots	int64	The amount of missed time slots.	
pubkey	string	The public key of this miner.	
previous_in_value	aelf.Hash	The InValue of the previous round.	
sup-	int32	The supposed order of mining for the next round.	
posed_order_of_next_1	ound		
fi-	int32	The final order of mining for the next round.	
nal_order_of_next_rou	nd		
actual_mining_times	google.protobuf.Timestan	pThe actual mining time, miners must fill actual mining	re-
		time when they do the mining.	peated
encrypted_pieces	MinerIn-	The encrypted pieces of InValue.	re-
	Round.EncryptedPiecesE		peated
decrypted_pieces	MinerIn-	The decrypted pieces of InValue.	re-
	Round.DecryptedPiecesE	ntry	peated
pro-	int64	The amount of produced tiny blocks.	
duced_tiny_blocks			
im-	int64	The irreversible block height that current miner	
plied_irreversible_bloc	k_height	recorded.	

AEDPoS.MinerInRound.DecryptedPiecesEntry

Field	Туре	Description	Label
key	string		
value	bytes		

AEDPoS.MinerInRound.EncryptedPiecesEntry

Field	Туре	Description	Label
key	string		
value	bytes		

AEDPoS.MinerList

Field	Type	Description	Label
pubkeys	bytes	The miners public key list.	repeated

AEDPoS.MinerListWithRoundNumber

Field	Туре	Description	Label
miner_list	MinerList	The list of miners.	
round_number	int64	The round number.	

AEDPoS.MinerReplaced

Field	Туре	Description	Label
new_miner_pubkey	string	The new miner public key.	

AEDPoS.MiningInformationUpdated

Field	Туре	Description	Label
pubkey	string	The miner public key.	
mining_time	google.protobuf.Timestamp	The current block time.	
behaviour	string	The behaviour of consensus.	
block_height	int64	The current block height.	
previous_block_hash	aelf.Hash	The previous block hash.	

AEDPoS.MiningRewardGenerated

Field	Type	Description	Label
term_number	int64	The number of term the mining reward is generated.	
amount	int64	The amount of mining reward.	

AEDPoS.PubkeyList

Field	Туре	Description	Label
pubkeys	string	The miners public key list.	repeated

${\bf AEDPoS.} Random Number Request Information$

Field	Type	Description	Label
target_round_number	int64	The random hash is likely generated during this round.	
order	int64		
expected_block_height	int64		

AEDPoS.RecordCandidateReplacementInput

Field	Туре	Description	Label
old_pubkey	string		
new_pubkey	string		

AEDPoS.Round

Field	Type	Description	La-
		·	bel
round_number	int64	The round number.	
real_time_miners_information	nRound.RealTimeMinersIn	O Connation winer public key ->	re-
		miner information.	peated
main_chain_miners_round_n	u <i>intoet</i>	The round number on the main chain	
blockchain_age	int64	The time from chain start to current round (sec-	
		onds).	
ex-	string	The miner public key that produced the extra	
tra_block_producer_of_prev	ious_round	block in the previous round.	
term_number	int64	The current term number.	
con-	int64	The height of the confirmed irreversible block.	
firmed_irreversible_block_h	eight		
con-	int64	The round number of the confirmed irreversible	
firmed_irreversible_block_rd	und_number	block.	
is_miner_list_just_changed	bool	Is miner list different from the the miner list in	
		the previous round.	
round_id_for_validation	int64	The round id, calculated by summing block pro-	
		ducers' expecting time (second).	

${\bf AEDPoS. Round. RealTime Miners Information Entry}$

Field	Type	Description	Label
key	string		
value	MinerInRound		

AEDPoS.SecretSharingInformation

Field	Туре	Description	Label
previous_round	Round	The previous round information.	
current_round_id	int64	The current round id.	
previous_round_id	int64	The previous round id.	

AEDPoS.TermInfo

Field	Type	Description	Label
term_number	int64		
round_number	int64		

AEDPoS.TermNumberLookUp

Field	Type	Description	Label
map	TermNumberLookUp.MapEntry	Term number -> Round number.	repeated

AEDPoS.TermNumberLookUp.MapEntry

Field	Type	Description	Label
key	int64		
value	int64		

AEDPoS.TinyBlockInput

Field	Type	Description	Label
round_id	int64	The round id.	
actual_mining_time	google.protobuf.Timestamp	The actual mining time.	
produced_blocks	int64	Count of blocks currently produced	

AEDPoS.UpdateValueInput

Field	Type	Description	La-
			bel
out_value	aelf.Hash	Calculated from current in value.	
signature	aelf.Hash	Calculated from current in value and signatures of	
		previous round.	
round_id	int64	To ensure the values to update will be apply to cor-	
		rect round by comparing round id.	
previous_in_value	aelf.Hash	Publish previous in value for validation previous	
		signature and previous out value.	
actual_mining_time	google.protobuf.Timestamp	The actual mining time, miners must fill actual	
		mining time when they do the mining.	
sup-	int32	The supposed order of mining for the next round.	
posed_order_of_next_	round		
tune_order_information	n <i>UpdateValueIn-</i>	The tuning order of mining for the next round,	re-
	put.TuneOrderInformationEnt	ryminer public key -> order.	peated
encrypted_pieces	UpdateValueIn-	The encrypted pieces of InValue.	re-
	put.EncryptedPiecesEntry		peated
decrypted_pieces	UpdateValueIn-	The decrypted pieces of InValue.	re-
	put.DecryptedPiecesEntry		peated
produced_blocks	int64	The amount of produced blocks.	
min-	UpdateValueIn-	The InValue in the previous round, miner public	re-
ers_previous_in_value	sput.MinersPreviousInValuesEr	1 7 7	peated
im-	int64	The irreversible block height that miner recorded.	
plied_irreversible_blo	ck_height		

AEDPoS.UpdateValueInput.DecryptedPiecesEntry

Field	Type	Description	Label
key	string		
value	bytes		

AEDPoS.UpdateValueInput.EncryptedPiecesEntry

Field	Туре	Description	Label
key	string		
value	bytes		

AEDPoS.UpdateValueInput.MinersPreviousInValuesEntry

Field	Туре	Description	Label
key	string		
value	aelf.Hash		

AEDPoS.UpdateValueInput.TuneOrderInformationEntry

Field	Type	Description	Label
key	string		
value	int32		

AEDPoS.VoteMinersCountInput

Field	Type	Description	Label
miners_count	int32		
amount	int64		

AEDPoS.AEIfConsensusBehaviour

Name	Number	Description
UPDATE_VALUE	0	
NEXT_ROUND	1	
NEXT_TERM	2	
NOTHING	3	
TINY_BLOCK	4	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS4

acs4.ConsensusCommand

Field	Туре	Description	La-
			bel
limit_milliseconds_of_mi	n ïng 3 2 block	Time limit of mining next block.	
hint	bytes	Context of Hint is diverse according to the consensus pro-	
		tocol we choose, so we use bytes.	
arranged_mining_time	google.protobuf.Tin	né Fhonti me of arrange mining.	
mining_due_time	google.protobuf.Tin	né Fhong xpiration time of mining.	

acs4.TransactionList

Field	Туре	Description	Label
transactions	aelf.Transaction	Consensus system transactions.	repeated

acs4.ValidationResult

Field	Туре	Description	Label
success	bool	Is successful.	
message	string	The error message.	
is_re_trigger	bool	Whether to trigger mining again.	

AEIf.Standards.ACS6

AEIf.Standards.ACS10

acs10.Dividends

Field	Туре	Description	Label
value	Dividends.ValueEntry	The dividends, symbol -> amount.	repeated

acs10.Dividends.ValueEntry

Field	Type	Description	Label
key	string		
value	int64		

acs10.DonateInput

Field	Type	Description	Label
symbol	string	The token symbol to donate.	
amount	int64	The amount to donate.	

acs10.DonationReceived

Field	Туре	Description	Label
from	aelf.Address	The address of donors.	
pool_contract	aelf.Address	The address of dividend pool.	
symbol	string	The token symbol Donated.	
amount	int64	The amount Donated.	

acs10.ReleaseInput

Field	Type	Description	Label
period_number	int64	The period number to release.	

acs10.SymbolList

Field	Туре	Description	Label
value	string	The token symbol list.	repeated

AEIf.Standards.ACS11

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La- bel
from	from Ad- The address of the sender of the transaction.		
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n <i>im163</i> 6	rThe height of the referenced block hash.	
ref_block_	plogrifiess	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Type	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> tklash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IO	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.5 AEIf.Contracts.Election

Election contract.

Used for voting for Block Producers.

Implement AEIf Standards ACS1.

20.5.1 Contract Methods

Method Name	Request Type	Response Type
InitialElectionContract	Election.InitialElectionContractInput	google.protobuf.Empty
RegisterElectionVotingEvent	google.protobuf.Empty	google.protobuf.Empty

20.5.2 Contract Types

AEIf.Contracts.Election

Election.CandidateDetail

Field	Туре	Description	Label
candidate_information	CandidateInformation	The candidate information.	
obtained_votes_amount	int64	The number of votes a candidate has obtained.	

Election.CandidateInformation

Field	Type	Description	Label
pubkey	string	Candidate's public key.	
terms	int64	The number of terms that the candidate is elected.	re-
			peated
produced_blocks	int64	The number of blocks the candidate has produced.	
missed_time_slots	int64	The time slot for which the candidate failed to produce	
		blocks.	
contin-	int64	The count of continual appointment.	
ual_appointment_count			
announce-	aelf.Hash	The transaction id when the candidate announced.	
ment_transaction_id			
is_current_candidate	bool	Indicate whether the candidate can be elected in the current	
		term.	

Election.CandidatePubkeyReplaced

Field	Туре	Description	Label
old_pubkey	string		
new_pubkey	string		

Election.CandidateVote

Field	Туре	Description	Label
ob-	aelf.Hash	The active voting record ids obtained.	re-
tained_active_voting_record_ids			peated
ob-	aelf.Hash	The active voting record ids that were with-	re-
tained_withdrawn_voting_record_id	S	drawn.	peated
ob-	int64	The total number of active votes obtained.	
tained_active_voted_votes_amount			
all_obtained_voted_votes_amount	int64	The total number of votes obtained.	
obtained_active_voting_records	ElectionVotin-	The active voting records.	re-
	gRecord		peated
ob-	ElectionVotin-	The voting records that were withdrawn.	re-
tained_withdrawn_votes_records	gRecord		peated
pubkey	bytes	Public key for candidate.	

Election.ChangeVotingOptionInput

Field	Туре	Description	Label
vote_id	aelf.Hash	The vote id to change.	
candidate_pubkey	string	The new candidate public key.	

Election.DataCenterRankingList

Field	Туре	Description	Label
data_cente	rsDataCenterRank-	The top n * 5 candidates with vote amount, candidate pub-	re-
	ingList.DataCentersEntry	lic key -> vote amount.	peated

${\bf Election. Data Center Ranking List. Data Centers Entry}$

F	Field	Type	Description	Label
ŀ	кеу	string		
1	value	int64		

Election.ElectionResult

Field	Туре	Description	Label
term_number	int64	The term number	
results	ElectionRe-	The election result, candidates' public key -> number of	re-
	sult.ResultsEntry	votes.	peated
is_active	bool	Whether an election is currently being held.	

Election.ElectionResult.ResultsEntry

Field	Type	Description	Label
key	string		
value	int64		

Election.ElectionVotingRecord

Field	Туре	Description	Label
voter	aelf.Address	The address of voter.	
candidate	string	The public key of candidate.	
amount	int64	Amount of voting.	
term_number	int64	The term number of voting.	
vote_id	aelf.Hash	The vote id.	
lock_time	int64	Vote lock time.	
unlock_timestamp	google.protobuf.Timestamp	The unlock timestamp.	
withdraw_timestamp	google.protobuf.Timestamp	The withdraw timestamp.	
vote_timestamp	google.protobuf.Timestamp	The vote timestamp.	
is_withdrawn	bool	Indicates if the vote has been withdrawn.	
weight	int64	Vote weight for sharing bonus.	
is_change_target	bool	Whether vote others.	

Election.ElectorVote

Field	Туре	Description	Label
ac-	aelf.Hash	The active voting record ids.	re-
tive_voting_record_ids			peated
with-	aelf.Hash	The voting record ids that were withdrawn.	re-
drawn_voting_record_ids			peated
ac-	int64	The total number of active votes.	
tive_voted_votes_amount			
all_voted_votes_amount	int64	The total number of votes (including the number of votes	
		withdrawn).	
active_voting_records	ElectionVotin-	The active voting records.	re-
	gRecord		peated
with-	ElectionVotin-	The voting records that were withdrawn.	re-
drawn_votes_records	gRecord		peated
pubkey	bytes	Public key for voter.	

Election.EvilMinerDetected

Field	Туре	Description	Label
pubkey	string	The public key of evil miner.	

Election.GetElectionResultInput

Field	Type	Description	Label
term_number	int64	The term number.	

${\bf Election. Get Miner Replacement Information Input}$

Field	Type	Description	Label
current_miner_list	string	The current miner list to inspect.	repeated

${\bf Election. Get Pageable Candidate Information Output}$

Field	Type	Description	Label
value	CandidateDetail	The details of the candidates.	repeated

Election.GetTermSnapshotInput

Field	Type	Description	Label
term_number	int64	The term number.	

Election.InitialElectionContractInput

Field	Туре	Description	Label
minimum_lock_time	int64	Minimum number of seconds for locking.	
maximum_lock_time	int64	Maximum number of seconds for locking.	
miner_list	string	The current miner list.	repeated
time_each_term	int64	The number of seconds per term.	
miner_increase_interval	int64	The interval second that increases the number of miners.	

Election.MinerReplacementInformation

Field	Type	Description	Label
alternative_candidate_pubkeys	string	The alternative candidate public keys.	repeated
evil_miner_pubkeys	string	The evil miner public keys.	repeated

Election.PageInformation

Field	Type	Description	Label
start	int32	The start index.	
length	int32	The number of records.	

Election.PubkeyList

Field	Type	Description	Label
value	bytes	Candidates' public keys	repeated

Election.ReplaceCandidatePubkeyInput

Field	Type	Description	Label
old_pubkey	string		
new_pubkey	string		

${\bf Election. Set Candidate AdminInput}$

Field	Type	Description	Label
pubkey	string		
admin	aelf.Address		

Election.SetTreasurySchemeldsInput

Field	Туре	Description	Label
treasury_hash	aelf.Hash	The scheme id of treasury reward.	
welfare_hash	aelf.Hash	The scheme id of welfare reward.	
subsidy_hash	aelf.Hash	The scheme id of subsidy reward.	
votes_reward_hash	aelf.Hash	The scheme id of votes reward.	
re_election_reward_hash	aelf.Hash	The scheme id of re-election reward.	

Election.TakeElectionSnapshotInput

Field	Type	Description	Label
term_number	int64	The term number to take snapshot.	
mined_blocks	int64	The number of mined blocks of this term.	
round_number	int64	The end round number of this term.	

Election.TermSnapshot

Field	Type	Description	Label
end_round_numberint64		The end round number of this term.	
mined_blocks	int64	The number of blocks mined in this term.	
election_result	TermSnap-	The election result, candidates' public key -> num-	re-
	shot.ElectionResultEntry	ber of votes.	peated

Election.TermSnapshot.ElectionResultEntry

Field	Type	Description	Label
key	string		
value	int64		

Election.UpdateCandidateInformationInput

Field	Type	Description	Label
pubkey	string	The candidate public key.	
recently_produced_blocks	int64	The number of blocks recently produced.	
recently_missed_time_slots	int64	The number of time slots recently missed.	
is_evil_node	bool	Is it a evil node. If true will remove the candidate.	

Election.UpdateMinersCountInput

Field	Туре	Description	Label
miners_count	int32	The count of miner.	

${\bf Election. Update Multiple Candidate Information Input}$

Field	Туре	Description	Label
value	$Update {\it Candidate Information Input}$	The candidate information to update.	repeated

Election.UpdateTermNumberInput

Field	Type	Description	Label
term_number	int64	The term number.	

Election.VoteInformation

Field	Type	Description	Label
amount	int64	Amount of voting.	
lock_time	int64	Vote lock time.	

Election.VoteMinerInput

Field	Type	Description	Label
candidate_pubkey	string	The candidate public key.	
amount	int64	The amount token to vote.	
end_timestamp	google.protobuf.Timestamp	The end timestamp of this vote.	
token	aelf.Hash	Used to generate vote id.	

Election.VoteWeightInterest

Field	Type	Description	Label
day	int32	Number of days locked.	
interest	int32	Locked interest.	
capital	int32		

Election.VoteWeightInterestList

Field	Туре	Description	Label
vote_weight_interest_infos	VoteWeightInterest	The weight of vote interest.	repeated

Election.VoteWeightProportion

Field	Type	Description	Label
time_proportion	int32	The weight of lock time.	
amount_proportion	int32	The weight of the votes cast.	

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Туре	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Туре	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n im16 34	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa- bytes When signing a transaction it's actually a subset of the fields: from/to and the target			
ture method as well as the parameter that were given. It also contains the reference bloc			
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

aelf. Transaction Executing State Set. Reads Entry

Field	Туре	Description	Label
key	string		
value	bool		

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
	,,		bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imm bler	The height of the block hat packages the transaction.	
block_h#dash		The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IØ	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.6 AEIf.Contracts.Genesis

Genesis contract.

Used to manage the deployment and update of contracts.

Implement AEIf Standards ACS0 and ACS1.

20.6.1 Contract Methods

Method Name	Poguast Type	Re-	Description

20.6.2 Contract Types

AEIf.Contracts.Genesis

Zero.ContractProposingInput

Field	Type	Description	La-
			bel
proposer	aelf.Address	The address of proposer for contract deployment/update.	
status	ContractProposingInputSta-	The status of proposal.	
	tus		
ex-	google.protobuf.Timestamp	The expiration time of proposal.	
pired_time			

Zero.InitializeInput

Field	Type	Description	La-
			bel
contract_deployment_authority_required	bool	Whether contract deployment/update requires author-	
		ity.	

Zero.ContractProposingInputStatus

Name	Number	Description
PROPOSED	0	Proposal is proposed.
APPROVED	1	Proposal is approved by parliament.
CODE_CHECK_PROPOSED	2	Code check is proposed.
CODE_CHECKED	3	Passed code checks.

${\bf Zero. Set Contract Proposal Expiration Time Period Input}$

Field	Type	Description	Label
expiration_time_period	int32	the period of expiration time	

acs 0. Code Check Required

Field	Type	Description	Label
code	bytes	The byte array of the contract code.	
proposed_contract_input_hash	aelf.Hash	The id of the proposed contract.	
category	sint32	The category of contract code(0: C#).	
is_system_contract	bool	Indicates if the contract is the system contract.	

acs0.CodeUpdated

Field	Туре	Description	Label
address	aelf.Address	The address of the updated contract.	
old_code_hash	aelf.Hash	The byte array of the old contract code.	
new_code_hash	aelf.Hash	The byte array of the new contract code.	
version	int32	The version of the current contract.	

acs0.ContractCodeCheckInput

Field	Type	Description	La-
			bel
contract_input	bytes	The byte array of the contract code to be checked.	
is_contract_deployment	bool	Whether the input contract is to be deployed or updated.	
code_check_release_methodring		Method to call after code check complete(DeploySmartContract or	
		UpdateSmartContract).	
pro-	aelf.Hasl	The id of the proposed contract.	
posed_contract_input_ha	sh		
category	sint32	The category of contract code(0: C#).	
is_system_contract	bool	Indicates if the contract is the system contract.	

acs0.ContractDeployed

Field	Type	Description	
author	aelf.Address	The author of the contract, this is the person who deployed the contract.	
code_hash	aelf.Hash	The hash of the contract code.	
address	aelf.Address	The address of the contract.	
version	int32	The version of the current contract.	
Name	aelf.Hash	The name of the contract. It has to be unique.	

acs0.ContractDeploymentInput

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	

acs0.ContractInfo

Field	Туре	Description	
			bel
serial_number	int64	The serial number of the contract.	
author	aelf.Address	The author of the contract, this is the person who deployed the con-	
		tract.	
category	sint32	The category of contract code(0: C#).	
code_hash	aelf.Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

acs0.ContractProposed

Field	Туре	Description	Label
proposed_contract_input_hash	aelf.Hash	The id of the proposed contract.	

acs0.ContractUpdateInput

Field	Туре	Description	Label
address	aelf.Address	The contract address that needs to be updated.	
code	bytes	The byte array of the new contract code.	

acs0.ReleaseContractInput

Field	Type	Description	Label
proposal_id	aelf.Hash	The hash of the proposal.	
proposed_contract_input_hash	aelf.Hash	The id of the proposed contract.	

acs0.SystemContractDeploymentInput

Field	Туре	Description	La-
			bel
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
name	aelf.Hash	The name of the contract. It has to be unique.	
transac-	SystemContractDeploymentIn-	An initial list of transactions for the system contract,	
tion_method_ca	al <u>þ</u> ulitsSystemTransactionMethodCal	Linshich is executed in sequence when the contract is de-	
		ployed.	

acs 0. System Contract Deployment Input. System Transaction Method Call

Field	Туре	Description	Label
method_name	string	The method name of system transaction.	
params	bytes	The params of system transaction method.	

acs 0. System Contract Deployment Input. System Transaction Method Call List

Field	Туре	Description	Label
value	SystemContractDeploymentIn-	The list of system transac-	re-
	put.SystemTransactionMethodCall	tions.	peated

acs 0. Validate System Contract Address Input

Field	Туре	Description	Label
system_contract_hash_name	aelf.Hash	The name hash of the contract.	
address	aelf.Address	The address of the contract.	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Type	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf. Binary Merkle Tree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Туре	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Туре	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Туре	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n im16 34	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

aelf. Transaction Executing State Set. Reads Entry

Field	Туре	Description	Label
key	string		
value	bool		

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-	
	,,		bel	
trans-	Hash	The transaction id.		
ac-				
tion_ic	1			
sta-	Trans-	The transaction result status.		
tus	action-			
	Result-			
	Status			
logs	Lo-	The log events.		
	gEvent		peated	
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract		
		and stored in the bloom filter after the transaction is executed. Through this filter, we		
		can quickly search for and determine whether a log exists in the transaction result.		
re-	bytes	The return value of the transaction execution.		
turn_v	turn_value			
block_nimtber The height of the block hat packages the transaction.		The height of the block hat packages the transaction.		
block_haklash The hash of the block hat packages the transaction.		The hash of the block hat packages the transaction.		
error	string	Failed execution error message.		

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IØ	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.7 AEIf.Contracts.MultiToken

MultiToken contract.

The MultiToken contract is mainly used to manage the user's account and transaction fees related Settings.

Implement AEIf Standards ACS1 and ACS2.

20.7.1 Contract Methods

Method Name	Request Type	Response
AdvanceResourceToken	tokenimpl.AdvanceResourceTokenInput	google.prot
TakeResourceTokenBack	tokenimpl.TakeResourceTokenBackInput	google.proi
RegisterCrossChainTokenContractAddress	tokenimpl.RegisterCrossChainTokenContractAddressInput	google.proi
SetFeeReceiver	aelf.Address	google.proi
ValidateTokenInfoExists	tokenimpl.ValidateTokenInfoExistsInput	google.prot
UpdateRental	tokenimpl.UpdateRentalInput	google.proi
UpdateRentedResources	tokenimpl.UpdateRentedResourcesInput	google.prot
TransferToContract	tokenimpl.TransferToContractInput	google.prot
ChangeSideChainRentalController	AuthorityInfo	google.prot
ChangeSymbolsToPayTXSizeFeeController	AuthorityInfo	google.proi
ChangeCrossChainTokenContractRegistrationController	AuthorityInfo	google.prot
ChangeUserFeeController	AuthorityInfo	google.prot
ChangeDeveloperController	AuthorityInfo	google.prot
GetFeeReceiver	google.protobuf.Empty	aelf.Addres
GetResourceUsage	google.protobuf.Empty	tokenimpl.F
GetSymbolsToPayTXSizeFeeController	google.protobuf.Empty	AuthorityIn
GetCrossChainTokenContractRegistrationController	google.protobuf.Empty	AuthorityIn
GetUserFeeController	google.protobuf.Empty	tokenimpl.U
GetDeveloperFeeController	google.protobuf.Empty	tokenimpl.1
GetSideChainRentalControllerCreateInfo	google.protobuf.Empty	AuthorityIn
GetVirtualAddressForLocking	tokenimpl.GetVirtualAddressForLockingInput	aelf.Addres
GetOwningRental	google.protobuf.Empty	tokenimpl.(
GetOwningRentalUnitValue	google.protobuf.Empty	tokenimpl.(
Create	token.CreateInput	google.proi
Issue	token.IssueInput	google.proi
Transfer	token.TransferInput	google.proi
TransferFrom	token.TransferFromInput	google.proi
Approve	token.ApproveInput	google.proi
UnApprove	token.UnApproveInput	google.proi
Lock	token.LockInput	google.proi
Unlock	token.UnlockInput	google.proi
Burn	token.BurnInput	google.pro
ChangeTokenIssuer	token.ChangeTokenIssuerInput	google.pro
SetPrimaryTokenSymbol	token.SetPrimaryTokenSymbolInput	google.pro
CrossChainTransfer	token.CrossChainTransferInput	google.pro
CrossChainReceiveToken	token.CrossChainReceiveTokenInput	google.pro
CrossChainCreateToken	token.CrossChainCreateTokenInput	google.pro
InitializeFromParentChain	token.InitializeFromParentChainInput	google.pro
ClaimTransactionFees	token.TotalTransactionFeesMap	google.pro
ChargeTransactionFees	token.ChargeTransactionFeesInput	token.Char
CheckThreshold	token.CheckThresholdInput	google.pro
InitialCoefficients	google.protobuf.Empty	google.pro
DonateResourceToken	token.TotalResourceTokensMaps	google.pro
ChargeResourceToken	token.ChargeResourceTokenInput	google.pro
CheckResourceToken	google.protobuf.Empty	google.pro

Method Name	Request Type	Response
SetSymbolsToPayTxSizeFee	token.SymbolListToPayTxSizeFee	google.proto
UpdateCoefficientsForSender	token.UpdateCoefficientsInput	google.proto
UpdateCoefficientsForContract	token.UpdateCoefficientsInput	google.proto
InitializeAuthorizedController	google.protobuf.Empty	google.proto

RemoveTransactionFeeDelegator	token.RemoveTransactionFeeDelegatorInput	google.proto
RemoveTransactionFeeDelegatee	token.RemoveTransactionFeeDelegateeInput	google.proto
GetMethodFeeFreeAllowances	aelf.Address	token.Metho
GetMethodFeeFreeAllowancesConfig	google.protobuf.Empty	token.Metho
GetTransactionFeeDelegationsOfADelegatee	to ken. Get Transaction Fee Delegations Of ADelegate eInput	token.Transo

Method Name	Request Type	Response	Description
		Туре	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptine method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Emprage the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ag Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.Er	m A tvythorityInfo	Query the method fee controller.
FeeController			

AEIf.Standards.ACS2

Method	Request	Response	Description
Name	Туре	Туре	
GetResource-	aelf.Transaction	n acs2.ResourceInf	Gets the resource information that the transaction execution
Info			depends on.

20.7.2 Contract Types

AEIf.Contracts.MultiToken

tokenimpl.AdvanceResourceTokenInput

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address to transfer.	
resource_token_symbol	string	The resource token symbol to transfer.	
amount	int64	The amount of resource token to transfer.	

tokenimpl.DeveloperFeeController

Field	Туре	Description	Label
root_controller	AuthorityInfo	The association that governs the organization.	
parliament_controller	AuthorityInfo	The parliament organization of members.	
developer_controller	AuthorityInfo	The developer organization of members.	

to kenimpl. Get Virtual Address For Locking Input

Field	Туре	Description	Label
address	aelf.Address	The address of the lock.	
lock_id	aelf.Hash	The id of the lock.	

tokenimpl.OwningRental

Field	Туре	Description	Label
re-	Own-	The amount of resource tokens owed, symbol ->	re-
source_amount	ingRental.ResourceAmountEntry	amount.	peated

to kenimpl. Owning Rental. Resource Amount Entry

Field	Type	Description	Label
key	string		
value	int64		

tokenimpl.OwningRentalUnitValue

Field	Туре	Description	Label
re-	OwningRentalUnit-	Resource unit price, symbol -> unit	re-
source_unit_value	Value.ResourceUnitValueEntry	price.	peated

tokenimpl.OwningRentalUnitValue.ResourceUnitValueEntry

Field	Туре	Description	Label
key	string		
value	int64		

to ken impl. Register Cross Chain Token Contract Address Input

Field	Туре	Description	Label
from_chain_id	int32	The source chain id.	
parent_chain_height	int64	The parent chain height of the transaction.	
transaction_bytes	bytes	The raw bytes of the transfer transaction.	
merkle_path	aelf.MerklePath	The merkle path created from the transaction.	
token_contract_address	aelf.Address	The token contract address.	

tokenimpl.ResourceUsage

Field	Type	Description	Label
value	ResourceUsage.ValueEntry	The amount of resource tokens usage, symbol -> amount.	repeated

to kenimpl. Resource Usage. Value Entry

Field	Туре	Description	Label
key	string		
value	int32		

tokenimpl.TakeResourceTokenBackInput

Field	Type	Description	Label
contract_address	aelf.Address	The contract address to take back.	
resource_token_symbol	string	The resource token symbol to take back.	
amount	int64	The amount of resource token to take back.	

tokenimpl.TransferToContractInput

Field	Type	Description	Label
symbol	string	The symbol of token.	
amount	int64	The amount of token.	
memo	string	The memo.	

tokenimpl.UpdateRentalInput

Field	Type	Description	Label
rental	UpdateRentalInput.RentalEntry	The unit price of resource tokens, symbol -> unit price.	repeated

tokenimpl.UpdateRentalInput.RentalEntry

Field	Type	Description	Label
key	string		
value	int64		

tokenimpl.UpdateRentedResourcesInput

Field	Type	Description	La-
			bel
re-	UpdateRentedResourcesIn-	Amount of resource tokens consumed per minute,	re-
source_amountentry		symbol -> resource consumption.	peated

to kenimpl. Update Rented Resources Input. Resource Amount Entry

Field	Type	Description	Label
key	string		
value	int32		

tokenimpl.UserFeeController

Field	Type	Description	Label
root_controller	AuthorityInfo	The association that governs the organization.	
parliament_controller	AuthorityInfo	The parliament organization of members.	
referendum_controller	AuthorityInfo	The referendum organization of members.	

to ken impl. Validate To ken Info Exists Input

Field	Type Description		Label
symbol	string	The symbol of the token.	
token_name	string	The full name of the token.	
total_supply	int64	The total supply of the token.	
decimals	int32	The precision of the token.	
issuer	aelf.Address	The address that created the token.	
is_burnable	bool	A flag indicating if this token is burnable.	
issue_chain_id	int32	The chain id of the token.	

token.AllCalculateFeeCoefficients

Field	Type	Description	Label
value	CalculateFeeCoefficients	The coefficients of fee Calculation.	repeated

token.ApproveInput

Field	Type	Description	Label
spender	aelf.Address	The address that allowance will be increased.	
symbol	string	The symbol of token to approve.	
amount	int64	The amount of token to approve.	

token.Approved

Field	Type	Description	Label
owner	aelf.Address	The address of the token owner.	
spender	aelf.Address	The address that allowance be increased.	
symbol	string	The symbol of approved token.	
amount	int64	The amount of approved token.	

token.BurnInput

Field	Туре	Description	Label
symbol	string	The symbol of token to burn.	
amount	int64	The amount of token to burn.	

token.Burned

Field	ld Type Description		Label
burner	aelf.Address	The address who wants to burn token.	
symbol	string	The symbol of burned token.	
amount	int64	The amount of burned token.	

token. Calculate Fee Algorithm Updated

Field	Туре	Description	La- bel
all_type_fee_coefficients	AllCalculateFeeCoeffi-	All calculate fee coefficients after modifica-	
	cients	tion.	

token.CalculateFeeCoefficients

Field	Type	Description	Label
fee_token_type	int32	The resource fee type, like READ, WRITE,	
		etc.	
piece_coefficients_list	CalculateFeePieceCoeffi-	Coefficients of one single piece.	re-
	cients		peated

token.CalculateFeePieceCoefficients

Field	Type	Description	Label
value	int32	Coefficients of one single piece. The first char is its type: liner / power. The second char	re-
		is its piece upper bound.	peated

token. Chain Primary Token Symbol Set

Field	Type	Description	Label
token_symbol	string	The symbol of token.	

token.ChangeTokenIssuerInput

Field	Туре	Description	Label
symbol	string	The token symbol.	
new_token_Issuer	aelf.Address	The new token issuer for change.	

token.ChargeResourceTokenInput

Field	Туре	Description	Label
cost_dic	ChargeResourceTokenIn-	Collection of charge resource token, Symbol-	re-
	put.CostDicEntry	>Amount.	peated
caller	aelf.Address	The sender of the transaction.	

token. Charge Resource Token Input. Cost Dic Entry

Field	Туре	Description	Label
key	string		
value	int64		

token. Charge Transaction Fees Input

Field	Туре	Description	Label
method_name	string	The method name of transaction.	
contract_address	aelf.Address	The contract address of transaction.	
transaction_size_fee	int64	The amount of transaction size fee.	
symbols_to_pay_tx_size_fee	SymbolToPayTxSizeFee	Transaction fee token information.	repeated

token. Charge Transaction Fees Output

Field	Туре	Description	Label
success	bool	Whether the charge was successful.	
charging_information	string	The charging information.	

token.CheckThresholdInput

Field	Туре	Description	Label
sender	aelf.Address	The sender of the transaction.	
sym-	CheckThresholdIn-	The threshold to set, Symbol-	re-
bol_to_threshold	put.SymbolToThresholdEntry	>Threshold.	peated
is_check_allowance	bool	Whether to check the allowance.	

token.CheckThresholdInput.SymbolToThresholdEntry

Field	Type	Description	Label
key	string		
value	int64		

token.ContractTotalResourceTokens

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address.	
tokens_map	TotalResourceTokensMap	Resource tokens to charge.	

token.CreateInput

Field	Туре	Description	Label
symbol	string	The symbol of the token.	
token_name	string	The full name of the token.	
total_supply	int64	The total supply of the token.	
decimals	int32	The precision of the token	
issuer	aelf.Address	The address that created the token.	
is_burnable	bool	A flag indicating if this token is burnable.	
lock_white_list	aelf.Address	A whitelist address list used to lock tokens.	repeated
issue_chain_id	int32	The chain id of the token.	

token.CrossChainCreateTokenInput

Field	Туре	Description	La-
			bel
from_chain_id	int32	The chain id of the chain on which the token was created.	
par-	int64	The height of the transaction that created the token.	
ent_chain_height			
transaction_bytes	bytes	The transaction that created the token.	
merkle_path	aelf.MerklePath	The merkle path created from the transaction that created the trans-	
		action.	

token. Cross Chain Receive Token Input

Field	Туре	Description	Label
from_chain_id	int32	The source chain id.	
parent_chain_height	int64	The height of the transfer transaction.	
transfer_transaction_bytes	bytes	The raw bytes of the transfer transaction.	
merkle_path	aelf.MerklePath	The merkle path created from the transfer transaction.	

token.CrossChainReceived

Field	Туре	Description	Label
from	aelf.Address	The source address of the transferred token.	
to	aelf.Address	The destination address of the transferred token.	
symbol	string	The symbol of the received token.	
amount	int64	The amount of the received token.	
memo	string	The memo.	
from_chain_id	int32	The destination chain id.	
issue_chain_id	int32	The chain id of the token.	
parent_chain_height	int64	The parent chain height of the transfer transaction.	

token.CrossChainTransferInput

Field	Туре	Description	Label
to	aelf.Address	The receiver of transfer.	
symbol	string	The symbol of token.	
amount	int64	The amount of token to transfer.	
memo	string	The memo.	
to_chain_id	int32	The destination chain id.	
issue_chain_id	int32	The chain id of the token.	

token.CrossChainTransferred

Field	Type	Description	Label
from	aelf.Address	The source address of the transferred token.	
to	aelf.Address	The destination address of the transferred token.	
symbol	string	The symbol of the transferred token.	
amount	int64	The amount of the transferred token.	
memo	string	The memo.	
to_chain_id	int32	The destination chain id.	
issue_chain_id	int32	The chain id of the token.	

token. Extra Token List Modified

Field	Type	Description	Label
symbol_list_to_pay_tx_size_fee	SymbolListToPayTxSizeFee	Transaction fee token information.	

token.GetAllowanceInput

Field	Туре	Description	Label
symbol	string	The symbol of token.	
owner	aelf.Address	The address of the token owner.	
spender	aelf.Address	The address of the spender.	

token.GetAllowanceOutput

Field	Type	Description	Label
symbol	string	The symbol of token.	
owner	aelf.Address	The address of the token owner.	
spender	aelf.Address	The address of the spender.	
allowance	int64	The amount of allowance.	

token.GetBalanceInput

Field	Туре	Description	Label
symbol	string	The symbol of token.	
owner	aelf.Address	The target address of the query.	

token.GetBalanceOutput

Field	Туре	Description	Label
symbol	string	The symbol of token.	
owner	aelf.Address	The target address of the query.	
balance	int64	The balance of the owner.	

token. Get Cross Chain Transfer Token Contract Address Input

Field	Type	Description	Label
chainId	int32	The chain id.	

token.GetLockedAmountInput

Field	Type	Description	Label
address	aelf.Address	The address of the lock.	
symbol	string	The token symbol.	
lock_id	aelf.Hash	The id of the lock.	

token.GetLockedAmountOutput

Field	Type	Description	Label
address	aelf.Address	The address of the lock.	
symbol	string	The token symbol.	
lock_id	aelf.Hash	The id of the lock.	
amount	int64	The locked amount.	

token.GetTokenInfoInput

Field	Type	Description	Label
symbol	string	The symbol of token.	

token.InitializeFromParentChainInput

Field	Type	Description	La-
			bel
resource_amount	InitializeFromParentChainIn-	The amount of re-	re-
	put.ResourceAmountEntry	source.	peated
regis-	InitializeFromParentChainIn-	The token contract	re-
tered_other_token_contract_a	d pnesBes gisteredOtherTokenContractAddressesEntry	addresses.	peated
creator	aelf.Address	The creator the	
		side chain.	

token. Initialize From Parent Chain Input. Registered Other Token Contract Addresses Entry

Field	Туре	Description	Label
key	int32		
value	aelf.Address		

token. Initialize From Parent Chain Input. Resource Amount Entry

Field	Type	Description	Label
key	string		
value	int32		

token.lsInWhiteListInput

Field	Type	Description	Label
symbol	string	The symbol of token.	
address	aelf.Address	The address to check.	

token.lssueInput

Field	Туре	Description	Label
symbol	string	The token symbol to issue.	
amount	int64	The token amount to issue.	
memo	string	The memo.	
to	aelf.Address	The target address to issue.	

token.lssued

Field	Туре	Description	Label
symbol	string	The symbol of issued token.	
amount	int64	The amount of issued token.	
memo	string	The memo.	
to	aelf.Address	The issued target address.	

token.LockInput

Field	Туре	Description	Label
address	aelf.Address	The one want to lock his token.	
lock_id	aelf.Hash	Id of the lock.	
symbol	string	The symbol of the token to lock.	
usage	string	a memo.	
amount	int64	The amount of tokens to lock.	

token.RentalAccountBalanceInsufficient

Field	, , ,	Description	Label
symbol	string	The symbol of insufficient rental account balance.	
amount	int64	The balance of the account.	

token.RentalCharged

Field	Туре	Description	Label
symbol	string	The symbol of rental fee charged.	
amount	int64	The amount of rental fee charged.	

token.SetPrimaryTokenSymbolInput

Field	Туре	Description	Label
symbol	string	The symbol of the token.	

token. Symbol List To Pay Tx Size Fee

Field	Type	Description	Label
symbols_to_pay_tx_size_fee	SymbolToPayTxSizeFee	Transaction fee token information.	repeated

token.SymbolToPayTxSizeFee

Field	Type	Description	La-
			bel
to-	string	The symbol of token.	
ken_sym	bol		
base_tok	eni <u>n</u> ts8€1	gfithe charge weight of primary token.	
added_to	k <i>èn<u>t</u>3</i> 2	ei The new added token charge weight. For example, the charge weight of primary Token is	
		set to 1. The newly added token charge weight is set to 10. If the transaction requires 1	
		unit of primary token, the user can also pay for 10 newly added tokens.	

token.TokenCreated

Field	Туре	Description	Label
symbol	string	The symbol of the token.	
token_name	string	The full name of the token.	
total_supply	int64	The total supply of the token.	
decimals	int32	The precision of the token.	
issuer	aelf.Address	The address that created the token.	
is_burnable	bool	A flag indicating if this token is burnable.	
issue_chain_id	int32	The chain id of the token.	

token.TokenInfo

Field	Type	Description	Label
symbol	string	The symbol of the token.f	
token_name	string	The full name of the token.	
supply	int64	The current supply of the token.	
total_supply	int64	The total supply of the token.	
decimals	int32	The precision of the token.	
issuer	aelf.Address	The address that created the token.	
is_burnable	bool	A flag indicating if this token is burnable.	
issue_chain_id	int32	The chain id of the token.	
issued	int64	The amount of issued tokens.	

token.TokenInfoList

Field	Туре	Description	Label
value	TokenInfo	List of token information.	repeated

token. Total Resource Tokens Map

Field	Туре	Description	Label
value	TotalResourceTokensMap.ValueEntry	Resource token dictionary, Symbol->Amount.	repeated

token.TotalResourceTokensMap.ValueEntry

Field	Type	Description	Label
key	string		
value	int64		

token. Total Resource Tokens Maps

Field	Type	Description	Label
value	ContractTotalResourceTokens	Resource tokens to charge.	repeated
block_hash	aelf.Hash	The hash of the block processing the transaction.	
block_height	int64	The height of the block processing the transaction.	

token.TotalTransactionFeesMap

Field	Type	Description	Label
value	TotalTransaction-	Token dictionary that charge transaction fee, Symbol-	re-
	FeesMap.ValueEntry	>Amount.	peated
block_hash	aelf.Hash	The hash of the block processing the transaction.	
block_height	int64	The height of the block processing the transaction.	

token. Total Transaction Fees Map. Value Entry

Field	Type	Description	Label
key	string		
value	int64		

token.TransactionFeeBill

Field	Туре	Description	Label
fees_map	TransactionFeeBill.FeesMapEntry	The transaction fee dictionary, Symbol->fee.	repeated

token.TransactionFeeBill.FeesMapEntry

Field	Type	Description	Label
key	string		
value	int64		

token.TransferFromInput

Field	Туре	Description	Label
from	aelf.Address	The source address of the token.	
to	aelf.Address	The destination address of the token.	
symbol	string	The symbol of the token to transfer.	
amount	int64	The amount to transfer.	
memo	string	The memo.	

token.TransferInput

Field	Туре	Description	Label
to	aelf.Address	The receiver of the token.	
symbol	string	The token symbol to transfer.	
amount	int64	The amount to to transfer.	
memo	string	The memo.	

token.Transferred

Field	Туре	Description	Label
from	aelf.Address	The source address of the transferred token.	
to	aelf.Address	The destination address of the transferred token.	
symbol	string	The symbol of the transferred token.	
amount	int64	The amount of the transferred token.	
memo	string	The memo.	

token.UnApproveInput

Field	Туре	Description	Label
spender	aelf.Address	The address that allowance will be decreased.	
symbol	string	The symbol of token to un-approve.	
amount	int64	The amount of token to un-approve.	

token.UnApproved

Field	Type	Description	Label
owner	aelf.Address	The address of the token owner.	
spender	aelf.Address	The address that allowance be decreased.	
symbol	string	The symbol of un-approved token.	
amount	int64	The amount of un-approved token.	

token.UnlockInput

Field	Туре	Description	Label
address	aelf.Address	The one want to un-lock his token.	
lock_id	aelf.Hash	Id of the lock.	
symbol	string	The symbol of the token to un-lock.	
usage	string	a memo.	
amount	int64	The amount of tokens to un-lock.	

token.UpdateCoefficientsInput

Field	Туре	Description	Label
piece_numbers	int32	The specify pieces gonna update.	repeated
coefficients	CalculateFeeCoefficients	Coefficients of one single type.	

token.FeeTypeEnum

Name	Number	Description
READ	0	
STORAGE	1	
WRITE	2	
TRAFFIC	3	
TX	4	

token. Method Fee Free Allowances Config

Field	Туре	Description	La-
			bel
free_allowan	c ¢ 8-	The allowance of each token when a user gets his allowance of the	
	ken.MethodFeeFreeAllo	w an tlearmount.	
re-	int64	The time needed for a user's allowance to be refreshed back to the	
fresh_second	ls	full amount. Unit: second	
threshold	int64	The required amount of ELF in possession for a user to be eligible	
		for transaction fee exemption.	

token. Set Transaction Fee Delegations Input

Field	Туре	Description	Label
delegator_address	aelf.Addresss	The address of delegator.	
delegations	map <string, int64=""></string,>	<token delegation="" symbol,=""></token>	

token. Set Transaction Fee Delegations Output

Field	Туре	Description	Label
success	bool	Whether set delegation success.	

token. Remove Transaction Fee Delegator Input

Field	Туре	Description	Label
delegator_address	aelf.Addresss	The address of delegator	

token. Remove Transaction Fee Delegate elnput

Field	Туре	Description	Label
delegatee_address	aelf.Addresss	The address of delegatee	

token.MethodFeeFreeAllowances

Field	Type	Description	Label
value	token. Method Fee Free Allowance		repeated

token.MethodFeeFreeAllowance

Field	Type	Description	Label
symbol	string	Token symbol	
amount	int64	The amount of fee free allowance	

token. Get Transaction Fee Delegations Of ADelegate elnput

Field	Type	Description	Label
delegatee_address	aelf.Addresss	The address of delegatee	
delegator_address	aelf.Addresss	The address of delegator	

token.TransactionFeeDelegations

Field	Туре	Description	Label
delegations	map <string, int64=""></string,>	The number of tokens allowed to be delegated	
block_height	int64	The block height when the information of delegation is added	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS2

acs2.ResourceInfo

Field	Туре	Description	Label
write_paths	aelf.ScopedStatePath	The state path that depends on when writing.	repeated
read_paths	aelf.ScopedStatePath	The state path that depends on when reading.	repeated
non_parallelizable	bool	Whether the transaction is not executed in parallel.	

AEIf.Types

aelf.Address

Field	Туре	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Туре	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Туре	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	n imm otek	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_n	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Type	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hdash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.8 AEIf.Contracts.Profit

Profit contract.

The Profit contract is an abstract layer for creating scheme to share bonus. Developers can build a system to distribute bonus by call this contract.

Implement AEIf Standards ACS1.

20.8.1 Contract Methods

Method	Request Type	Response	Description
Name		Туре	
Cre-	Profit.CreateSchen	ie lve phuHash	Create a scheme for profit distribution, and return the created
ateScheme			scheme id.
AddBenefi-	Profit.AddBeneficio	ır ybıyılt .protobu	f. Endptheneficiary to scheme.
ciary			•
Re-	Profit.RemoveBene	fi gioorg le.pur otobu	f. Reapproyve beneficiary from scheme.
moveBene-			
ficiary			
AddBenefi-	Profit.AddBeneficio	ır igasdış ba ıp rotobu	f. Evaporly add beneficiary to scheme.
ciaries			
Re-	Profit.RemoveBene	fi giowjdeIppott obu	f. Brayoty remove beneficiary from scheme.
moveBene-			
ficiaries			
Con-	Profit.ContributePr	ro gtxdgfaup rotobu	f. Exaptyibute profit to a scheme.
tributeProf-			
its			
ClaimProf-	Profit.ClaimProfits	Ingowgle.protobu	f. Ethop beneficiary draws tokens from the scheme.
its			
Dis-	Profit.DistributePr	of gohglut protobu	f. Dispribute profits to schemes, including its sub scheme ac-
tributeProf-			cording to period and token symbol, should be called by the
its			manager.
AddSub-	Profit.AddSubSche	m ghqqlt .protobu	f. And ptysub scheme to a scheme. This will effectively add the
Scheme			specified sub-scheme as a beneficiary of the parent scheme.
Re-	Profit.RemoveSubS	cl genag lenpur otobuj	f. Receptorve sub scheme from a scheme.
moveSub-			
Scheme			
ResetMan-	Profit.ResetManage	er kopul e.protobu	f. Receptly the manager of a scheme.
ager			
GetManag-	Profit.GetManagin	g SPc/hogith. (I desditapd 8	chenaldschemes managed by the specified manager.
ingSchemeIds			
GetScheme	aelf.Hash	Profit.Scheme	Get scheme according to scheme id.
GetSchemeAd	l-Profit.SchemePerio	daelf.Address	Get the virtual address of the number of period of the scheme.
dress			
GetDis-	Profit.SchemePerio	dProfit.Distribut	edPuerfusthefalistributed profit information for the specified pe-
tributed-			riod.
ProfitsInfo			
GetProfit-	Profit.GetProfitDet	a iPshfptuP rofitDet	aQuery the beneficiary's profit information on the scheme.
Details			
GetProfitA-	Profit.GetProfitAm	oı gabıybıp rotobu	f. Deterly a her amount of profit according to token symbol. (up to
mount			10 periods).
GetProf-	Profit.ClaimProfits	In pro fit.Received	Profits Malp profit (up to 10 periods).
itsMap			

AEIf.Standards.ACS1

		Туре	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptive method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Empringe the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri agMaMe thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.E	n A toythorityInfo	Query the method fee controller.
FeeController			

20.8.2 Contract Types

AEIf.Contracts.Profit

Profit.AddBeneficiariesInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
beneficiary_shares	BeneficiaryShare	The beneficiary information.	repeated
end_period	int64	The end period which the beneficiary receives the profit.	

Profit.AddBeneficiaryInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
beneficiary_share	BeneficiaryShare	The beneficiary information.	
end_period	int64	The end period which the beneficiary receives the profit.	

Profit.AddSubSchemeInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The parent scheme id.	
sub_scheme_id	aelf.Hash	The sub scheme id.	
sub_scheme_shares	int64	The profit weight of sub scheme.	

Profit.BeneficiaryShare

Field	Type	Description	Label
beneficiary	aelf.Address	The address of beneficiary.	
shares	int64	The profit weight of the beneficiary in the scheme.	

Profit.ClaimProfitsInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
beneficiary	aelf.Address	The address of beneficiary.	

Profit.ContributeProfitsInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id to contribute.	
amount	int64	The amount to contribute.	
period	int64	The number of periods in which the income is used for dividends.	
symbol	string	The token symbol to contribute.	

Profit.CreateSchemeInput

Field	Туре	Description	La-
			bel
profit_receiving_due_period_coun	t <i>int64</i>	Period of profit distribution.	
is_release_all_balance_every_time	_ by o@efaul	Whether all the schemes balance will be distributed during	
		distribution each period.	
delay_distribute_period_count	int32	Delay distribute period.	
manager	aelf.Addre	ssThe manager of this scheme, the default is the creator.	
can_remove_beneficiary_directly	bool	Whether you can directly remove the beneficiary.	
token	aelf.Hash	Use to generate scheme id.	

Profit.CreatedSchemeIds

Field	Type	Description	Label
scheme_ids	aelf.Hash	The scheme ids.	repeated

Profit.DistributeProfitsInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id to distribute.	
period	int64	The period number to distribute, should be the cur-	
		rent period.	
amounts_maj	DistributeProfitsIn-	The amount to distribute, symbol -> amount.	re-
	put.AmountsMapEntry		peated

${\bf Profit. Distribute Profits Input. Amounts Map Entry}$

Field	Туре	Description	Label
key	string		
value	int64		

Profit.DistributedProfitsInfo

Field	Type	Description	Label
to-	int64	The total amount of shares in this scheme at the cur-	
tal_shares		rent period.	
amounts_maj	p DistributedProf-	The contributed amount in this scheme at the current	re-
	itsInfo.AmountsMapEntry	period.	peated
is_released	bool	Whether released.	

${\bf Profit. Distributed Profits Info. Amounts Map Entry}$

Field	Туре	Description	Label
key	string		
value	sint64		

Profit.GetManagingSchemeldsInput

Field	Type	Description	Label
manager	aelf.Address	The manager address.	

Profit.GetProfitAmountInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
symbol	string	The token symbol.	
beneficiary	aelf.Address	The beneficiary's address.	

Profit.GetProfitDetailsInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
beneficiary	aelf.Address	The address of beneficiary.	

Profit.ProfitDetail

Field	Type	Description	Label
start_period	int64	The start period number.	
end_period	int64	The end period number.	
shares	int64	The weight of the proceeds on the current period of the scheme.	
last_profit_period	int64	The last period number that the beneficiary received the profit.	
is_weight_removed	bool	Whether the weight has been removed.	

Profit.ProfitDetails

Field	Туре	Description	Label
details	ProfitDetail	The profit information.	repeated

Profit.ProfitsClaimed

Field	Туре	Description	Label
beneficiary	aelf.Address	The beneficiary's address claimed.	
symbol	string	The token symbol claimed.	
amount	int64	The amount claimed.	
period	int64	The period number claimed.	
claimer_shares	int64	The shares of the claimer.	
total_shares	int64	The total shares at the current period.	

Profit.ReceivedProfitsMap

Field	Type	Description	Label
value	ReceivedProf-	The collection of profits received, token symbol -> amount.	re-
	itsMap.ValueEntry		peated

Profit.ReceivedProfitsMap.ValueEntry

Field	Туре	Description	Label
key	string		
value	int64		

Profit.RemoveBeneficiariesInput

Field	Type	Description	Label
beneficiaries	aelf.Address	The addresses of beneficiary.	repeated
scheme_id	aelf.Hash	The scheme id.	

Profit.RemoveBeneficiaryInput

Field	Туре	Description	Label
beneficiary	aelf.Address	The address of beneficiary.	
scheme_id	aelf.Hash	The scheme id.	

Profit.RemoveSubSchemeInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The parent scheme id.	
sub_scheme_id	aelf.Hash	The sub scheme id.	

Profit.ResetManagerInput

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
new_manager	aelf.Address	The address of new manager.	

Profit.Scheme

Field	Туре	Description	La-
			bel
virtual_address	aelf.Address	The virtual address of the scheme.	
total_shares	int64	The total weight of the scheme.	
manager	aelf.Address	The manager of the scheme.	
current_period	int64	The current period.	
sub_schemes	SchemeBeneficia-	Sub schemes information.	re-
	ryShare		peated
can_remove_beneficiary_d	ir <i>botdy</i>	Whether you can directly remove the beneficiary.	
profit_receiving_due_perio	d <i>in</i> totht	Period of profit distribution.	
is_release_all_balance_eve	ry <u>b</u> ainhe_by_default	Whether all the schemes balance will be distributed	
		during distribution each period.	
scheme_id	aelf.Hash	The is of the scheme.	
de-	int32	Delay distribute period.	
lay_distribute_period_cour	it		
cached_delay_total_shares	Scheme.CachedDelayT	o Resolvande the nation seeme's current total share for deferred	re-
		distribution of benefits, period -> total shares.	peated

Method Name	Request Type	Response Type	Description
ProposeCrossChain- Indexing			Elimptpose once cross chain indexing.
ReleaseCrossChain- IndexingProposal			Explipage the proposed indexing if already approved.
RequestSideChain- Creation			Eliptruest side chain creation.
ReleaseSideChain- Creation			Elikplisase the side chain creation request if already approved and it will call the method CreateSideChain.
CreateSideChain	acs7.CreateSideCh	ai g<i>biggle</i>. protobuf.	In C32 Med the side chain and returns the newly created side chain ID. Only SideChainLifetimeController is permitted to invoke this method.
Recharge			ERPCharge for the specified side chain.
DisposeSideChain			InDIANAMEE a side chain according to side chain id. Only SideChainLifetimeController is permitted to invoke this method.
AdjustIndex- ingFeePrice	acs7.AdjustIndexin	g Fæðigþu protobuf.	EnAphinst side chain indexing fee. Only IndexingFeeController is permitted to invoke this method.
VerifyTransaction	0.5	0 10 1	Booth William oss chain transaction.
Get- SideChainIdAnd- Height	google.protobuf.Em	p ty cs7.ChainIdAn	different distribution description of the current chain.
GetSideChainIn- dexingInformation- List	google.protobuf.Em	p t ycs7.SideChainI	ndastrightefaing attituthistion of side chains.
GetAllChainsI- dAndHeight			diffeight Dind recorded height of all chains.
GetIndexed- SideChainBlock- DataByHeight			e ChetihoBlock dana cof indexed side chain according to height.
GetBoundPar- entChainHeigh- tAndMerklePathBy- Height	google.protobuf.Int	6 4)∕as∏u€ rossChair	Macking path/bound up with side chain according to height.
GetChainInitializa- tionData	google.protobuf.Int	3 2MasUiC hainInitia	li Cart án iDada zation data for specified side chain.

20.9.2 Contract Types

AEIf.Contracts.CrossChain

Cross Chain. Accept Cross Chain Indexing Proposal Input

Field	Type	Description	Label
chain_id	int32	The chain id of accepted indexing.	

${\bf Cross Chain. Chain Indexing Proposal}$

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The id of cross chain indexing proposal.	
proposer	aelf.Address	The proposer of cross chain indexing.	
pro-	acs7.CrossChainBlockData	The cross chain data proposed.	
posed_cross_chain_block_data			
status	Cross Chain Indexing Proposal-	The status of of cross chain indexing	
	Status	proposal.	
chain_id	int32	The chain id of the indexing.	

Cross Chain. Change Side Chain Indexing Fee Controller Input

Field	Type	Description	Label
chain_id	int32	The side chain id.	
authority_info	AuthorityInfo	The changed controller of indexing fee.	

${\bf Cross Chain. Cross Chain Indexing Controller Changed}$

Field	Туре	Description	Label
authority_info	AuthorityInfo	The changed controller of indexing.	

CrossChain.Disposed

Field	Type	Description	Label
chain_id	int32	The disposed side chain id.	

CrossChain.GetChainStatusOutput

Field	Туре	Description	Label
status	SideChainStatus	The status of side chain.	

${\bf Cross Chain. GetIndexing Proposal Status Output}$

Field	Туре	Description	La-
			bel
chain_indexing_propo@d <u>tlstdexing</u> ProposalStatusOut-		The collection of pending indexing	re-
	put.ChainIndexingProposalStatusEntry	proposal, the key is chain id.	peated

Cross Chain. GetIndexing Proposal Status Output. Chain Indexing Proposal Status Entry

Field	Туре	Description	Label
key	int32		
value	PendingChainIndexingProposalStatus	-	

Cross Chain. Get Pending Cross Chain Indexing Proposal Output

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The proposal id of cross chain indexing.	
proposer	aelf.Address	The proposer of cross chain indexing pro-	
		posal.	
to_be_released	bool	True if the proposal can be released, otherwise	
		false.	
pro-	acs7.CrossChainBlockDa	<i>td</i> The cross chain data proposed.	
posed_cross_chain_block_data			
expired_time	google.protobuf.Timestan	<i>p</i> The proposal expiration time.	

CrossChain.InitializeInput

Field	Type	Description	Label
parent_chain_id	int32	The id of parent chain.	
creation_height_on_parent_chain	int64	The height of side chain created on parent chain.	
is_privilege_preserved	bool	True if chain privilege needed, otherwise false.	

Cross Chain. Pending Chain Index in gProposal Status

Field	Туре	Description	La-
		-	bel
proposal_id	aelf.Hash	The id of cross chain indexing proposal.	
proposer	aelf.Address	The proposer of cross chain indexing.	
to_be_released	bool	True if the proposal can be released, otherwise	
		false.	
pro-	acs7.CrossChainBlockDa	taThe cross chain data proposed.	
posed_cross_chain_block_data			
expired_time	google.protobuf.Timestan	<i>p</i> The proposal expiration time.	

${\bf CrossChain. Proposed CrossChain Indexing}$

Field	Туре	Description	La-
			bel
chain_indexing_propos	al <u>P</u> coplectidGsossChainIndex-	The collection of chain indexing	re-
	ing. Chain Index ing Proposal Collections Entremely and the proposal continuous and	y proposal, the key is chain id.	peated

Cross Chain. Proposed Cross Chain Indexing. Chain Indexing Proposal Collections Entry

Field	Type	Description	Label
key	int32		
value	ChainIndexingProposal		

CrossChain.SideChainCreatedEvent

Field	Туре	Description	Label
creator	aelf.Address	The proposer who propose to create the side chain.	
chainId	int32	The created side chain id.	

${\bf Cross Chain. Side Chain Creation Request State}$

Field	Туре	Description	La-	
			bel	
side_chain_creation_requestacs7.SideChainCreationRequestThe parameters of creating side chain.				
expired_time	google.protobuf.Timestamp	The expiration date of the proposal.		
proposer	aelf.Address	The proposer who proposed to create the side		
		chain.		

Cross Chain. Side Chain Indexing Fee Controller Changed

Field	Туре	Description	Label
chain_id	int32	The side chain id.	
authority_info	AuthorityInfo	The changed controller of side chain indexing fee.	

CrossChain.SideChainInfo

Field	Туре	Description	Label
proposer	aelf.Address	The proposer who propose to create the side	
		chain.	
side_chain_status	SideChainStatus	The status of side chain.	
side_chain_id	int32	The side chain id.	
creation_timestamp	google.protobuf.Timestamp	The time of side chain created.	
cre-	int64	The height of side chain created on parent	
ation_height_on_parent_chain		chain.	
indexing_price	int64	The price of indexing fee.	
is_privilege_preserved	bool	True if chain privilege needed, otherwise	
		false.	
arrears_info	SideChain-	creditor and amounts for the chain indexing	re-
	Info.ArrearsInfoEntry	fee debt	peated
indexing_fee_controller	AuthorityInfo	The controller of indexing fee.	

CrossChain.SideChainInfo.ArrearsInfoEntry

Field	Type	Description	Label
key	string		
value	int64		

${\bf CrossChain. Side Chain Lifetime Controller Changed}$

Field	Туре	Description	Label
authority_info	AuthorityInfo	The changed controller of side chain lifetime.	

${\bf Cross Chain Indexing Proposal Status}$

Name	Number	Description
NON_PROPOSED	0	
PENDING	1	The proposal is pending.
ACCEPTED	2	The proposal has been released.

CrossChain.SideChainStatus

Name	Number	Description
FATAL	0	Currently no meaning.
ACTIVE	1	The side chain is being indexed.
INDEXING_FEE_DEBT	2	The side chain is in debt for indexing fee.
TERMINATED	3	The side chain is disposed.

AEIf.Standards.ACS1

acs1.MethodFee

Field	Type	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS7

acs7.AdjustIndexingFeeInput

Field	Type	Description	Label
side_chain_id	int32	The side chain id to adjust.	
indexing_fee	int64	The new price of indexing fee.	

acs7.ChainIdAndHeightDict

Field	Туре	Description	La-
			bel
id_height_d	di C thainIdAndHeight-	A collection of chain ids and heights, where the key is the	re-
	Dict.IdHeightDictEntry	chain id and the value is the height.	peated

acs 7. Chain Id And Height Dict. Id Height Dict Entry

Field	Type	Description	Label
key	int32		
value	int64		

acs7.ChainInitializationConsensusInfo

Field	Type	Description	Label
initial_consensus_data	bytes	Initial consensus data.	

acs7.ChainInitializationData

Field	Туре	Description	La- bel
chain_id	int32	The id of side chain.	
creator	aelf.Address	The side chain creator.	
creation_timestamp	google.protobuf.Timest	affipe timestamp for side chain creation.	
cre-	int64	The height of side chain creation on parent chain.	
ation_height_on_parent_o	hain		
chain_creator_privilege_j	pr bær lved	Creator privilege boolean flag: True if chain creator	
		privilege preserved, otherwise false.	
par-	aelf.Address	Parent chain token contract address.	
ent_chain_token_contrac	_address		
chain_initialization_cons	en Shs<u>ui</u>ndho itialization-	Initial consensus information.	
	ConsensusInfo		
native_token_info_data	bytes	The native token info.	
resource_token_info	ResourceTokenInfo	The resource token information.	
chain_primary_token_inf	o ChainPrimaryToken-	The chain primary token information.	
	Info		

acs7.ChainPrimaryTokenInfo

Field	Type	Description	Label
chain_primary_token_data	bytes	The side chain primary token data.	
side_chain_token_initial_issue_l	stSideChainTokenIni-	The side chain primary token initial issue	re-
	tialIssue	list.	peated

acs7.CreateSideChainInput

Field	Туре	Description	La-
			bel
side_chain_creation_request	SideChainCreationRe-	The request information of the side chain cre-	
	quest	ation.	
proposer	aelf.Address	The proposer of the side chain creation.	

acs7.CrossChainBlockData

Field	Type	Description	Label
side_chain_block_data_list	SideChainBlockData	The side chain block data list to index.	repeated
parent_chain_block_data_list	ParentChainBlockData	The parent chain block data list to index.	repeated

acs7.CrossChainExtraData

Field	Type	Description	La-
			bel
transac-	aelf.Hash	Merkle tree root of side chain block transaction status	
tion_status_merkle_tree_root		root.	

acs 7. Cross Chain Indexing Data Proposed Event

Field	Туре	Description	Label
proposed_cross_chain_data	CrossChainBlockData	Proposed cross chain data to be indexed.	
proposal_id	aelf.Hash	The proposal id.	

acs7.CrossChainMerkleProofContext

Field	Туре	Description	La- bel
bound_parent_chain_height	int64	The height of parent chain bound up with side chain.	
merkle_path_from_parent_chain	aelf.MerklePath	The merkle path generated from parent chain.	

acs7.IndexedParentChainBlockData

Field	Туре	Description	Label
local_chain_height	int64	The height of the local chain when indexing the par-	
		ent chain.	
par-	ParentChainBlock-	Parent chain block data.	re-
ent_chain_block_data_list	Data		peated

acs7.IndexedSideChainBlockData

Field	Type	Description	Label
side_chain_block_data_list	SideChainBlockData	Side chain block data.	repeated

acs7.ParentChainBlockData

Field	Type	Description	La-
			bel
height	int64	The height of parent chain.	
cross_chain_extra_data	CrossChainExtraData	The merkle tree root computing from side chain	
		roots.	
chain_id	int32	The parent chain id.	
transac-	aelf.Hash	The merkle tree root computing from transac-	
tion_status_merkle_tree	_root	tions status in parent chain block.	
indexed_merkle_path	ParentChainBlock-	Indexed block height from side chain and	re-
	Data.IndexedMerklePathEntry	merkle path for this side chain block	peated
extra_data	ParentChainBlock-	Extra data map.	re-
	Data.ExtraDataEntry		peated

acs7.ParentChainBlockData.ExtraDataEntry

Field	Туре	Description	Label
key	string		
value	bytes		

acs 7. Parent Chain Block Data. Indexed Merkle Path Entry

Field	Туре	Description	Label
key	int64		
value	aelf.MerklePath		

acs7.RechargeInput

Field	Type	Description	Label
chain_id	int32	The chain id to recharge.	
amount	int64	The amount to recharge.	

acs 7. Release Cross Chain Indexing Proposal Input

Field	Type	Description	Label
chain_id_list	int32	List of chain ids to release.	repeated

acs7.ReleaseSideChainCreationInput

Field	Туре	Description	Label
proposal_id	aelf.Hash	The proposal id of side chain creation.	

acs7.ResourceTokenInfo

Field	Туре	Description	Label
re-	bytes	The resource token informa-	
source_token_list_data		tion.	
ini-	ResourceToken-	The initial resource token	re-
tial_resource_amount	Info.InitialResourceAmountEntry	amount.	peated

acs 7. Resource Token Info. Initial Resource Amount Entry

Field	Type	Description	Label
key	string		
value	int32		

acs7.SideChainBlockData

Field	Туре	Description	La-
			bel
height	int64	The height of side chain block.	
block_header_hash	aelf.Hash	The hash of side chain block.	
transac-	aelf.Hash	The merkle tree root computing from transactions status in side	
tion_status_merkle_tree_root		chain block.	
chain_id	int32	The id of side chain.	

acs7.SideChainBlockDataIndexed

acs7.SideChainCreationRequest

Field	Type	Description	La-
			bel
indexing_price	int64	The cross chain indexing price.	
locked_token_amoun	t <i>int64</i>	Initial locked balance for a new side chain.	
is_privilege_preserve	d <i>bool</i>	Creator privilege boolean flag: True if chain cre-	
		ator privilege preserved, otherwise false.	
side_chain_token_cre	a Siole_GbqiveTo kenCreationRe-	Side chain token information.	
	quest		
side_chain_token_ini	ti Si<u>d</u>esCihe u <u>i</u> hiTokenInitialIssue	A list of accounts and amounts that will be issued	re-
		when the chain starts.	peated
ini-	SideChainCreationRe-	The initial rent resources.	re-
tial_resource_amoun	quest.InitialResourceAmountEnt	ly .	peated

acs 7. Side Chain Creation Request. Initial Resource Amount Entry

Field	Type	Description	Label
key	string		
value	int32		

acs7.SideChainIndexingInformation

Field	Type	Description	Label
chain_id	int32	The side chain id.	
indexed_height	int64	The indexed height.	

acs 7. Side Chain Indexing Information List

Field	Туре	Description	Label
index-	SideChainIndexingInfor-	A list contains indexing information of side	re-
ing_information_list	mation	chains.	peated

acs 7. Side Chain Token Creation Request

Field	Туре	Description	Label
side_chain_token_symbol	string	Token symbol of the side chain to be created	
side_chain_token_name	string	Token name of the side chain to be created	
side_chain_token_total_supply	int64	Token total supply of the side chain to be created	
side_chain_token_decimals	int32	Token decimals of the side chain to be created	

acs7.SideChainTokenInitialIssue

Field	Type	Description	Label
address	aelf.Address	The account that will be issued.	
amount	int64	The amount that will be issued.	

acs7.VerifyTransactionInput

Field	Туре	Description	Label
transaction_id	aelf.Hash	The cross chain transaction id to verify.	
path	aelf.MerklePath	The merkle path of the transaction.	
parent_chain_height	int64	The height of parent chain that indexing this transaction.	
verified_chain_id	int32	The chain if to verify.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Туре	Description	Label
value	bytes		

aelf.LogEvent

Field	Type	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Туре	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	nimmotek	rThe height of the referenced block hash.	
ref_block_	plognes	The first four bytes of the referenced block hash.	
method_n	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Type	Description	Label
key	string		
value	bool		

aelf. Transaction Executing State Set. Reads Entry

Field	Туре	Description	Label
key	string		
value	bool		

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Туре	Description	La-
	71	'	bel
trans-	Hash	The transaction id.	
ac-			
tion_id	l		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imtol er	The height of the block hat packages the transaction.	
block_h##ash		The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

AuthorityInfo

Field	Type	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.10 AEIf.Contracts.Treasury

Treasury contract.

Used for distributing bonus' to voters and candidates during the election process.

Implement AEIf Standards ACS1 and ACS10.

20.10.1 Contract Methods

Method Name	Request Type	Response Type	Description
InitialTrea-	google.protobuf.Empty	google.protobuf.Empty	Initialize treasury contract.
suryContract			
InitialMin-	google.protobuf.Empty	google.protobuf.Empty	Initialize the sub-item of the bonus
ingRewardProfi-			scheme.
tItem			
DonateAll	Trea-	google.protobuf.Empty	Donate all tokens owned by the sender.
	sury.DonateAllInput		
SetDividend-	Trea-	google.protobuf.Empty	Set the dividend weight of the sub-item of
PoolWeightSet-	sury.DividendPoolWeigh	tSetting	the dividend item.
ting			
SetMinerRe-	Trea-	google.protobuf.Empty	Set the miner reward weight.
wardWeightSet-	sury.MinerRewardWeigh	tSetting	
ting			
UpdateMi-	google.protobuf.Int64Va	u g oogle.protobuf.Empty	Set the reward for mining.
ningReward			_
ChangeTrea-	AuthorityInfo	google.protobuf.Empty	Change the governance authority infor-
suryController			mation for treasury contract.
RecordMin-	Trea-	google.protobuf.Empty	AEDPoS Contract can notify Treasury
erReplacement	sury.RecordMinerReplac	ementInput	Contract to aware miner replacement
			happened.
GetWel-	Trea-	Trea-	Used to estimate the revenue weight of
fareRewar-	sury.GetWelfareRewardA	n sann.iSatNy dlf lnpR tewardA	mb00000anoken9aapued by users.
dAmountSam-			
ple			
GetTrea-	google.protobuf.Empty	aelf.Hash	Get the scheme id of treasury.
surySchemeId			
GetDividend-	google.protobuf.Empty	Trea-	Query the weight percentage of dividend
PoolWeightPro-		sury.DividendPoolWeight	Ppopodriticms.
portion			
GetMinerRe-	google.protobuf.Empty	Trea-	Query the weight percentage of the divi-
wardWeightPro-		sury.MinerRewardWeight	Proportion for miner.
portion			_
GetTrea-	google.protobuf.Empty	AuthorityInfo	Query the governance authority informa-
suryController	• • •		tion.

AEIf.Standards.ACS1

Method Name	Request Type	Response	Description
		Туре	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptine method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Ethapmige the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ng Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.E	m A tothorityInfo	Query the method fee controller.
FeeController			

AEIf.Standards.ACS10

Method	Request	Re-	Description
Name	Туре	sponse	
		Type	
Donate	acs10.Donate	In gao gle.prote	bb)6hatesytokens from the caller to the treasury. If the tokens are not
			native tokens in the current chain, they will be first converted to the
			native token.

20.10.2 Contract Types

AEIf.Contracts.Treasury

Treasury.DividendPoolWeightProportion

Field	Туре	Description	Label
citizen_welfare_proportion_info	SchemeProportionInfo	The proportion of citizen welfare.	
backup_subsidy_proportion_info	SchemeProportionInfo	The proportion of candidate nodes.	
miner_reward_proportion_info	SchemeProportionInfo	The proportion of miner	

Treasury.DividendPoolWeightSetting

Field	Type	Description	Label
citizen_welfare_weight	int32	The dividend weight of citizen welfare.	
backup_subsidy_weight	int32	The dividend weight of candidate nodes.	
miner_reward_weight	int32	The dividend weight of miner.	

Treasury.DonateAllInput

Field	Туре	Description	Label
symbol	string	The token symbol to donate.	

Treasury.GetWelfareRewardAmountSampleInput

Field	Type	Description	Label
value	int64	Token lock time.	repeated

Treasury. Get Welfare Reward Amount Sample Output

Field	Type	Description	Label
value	int64	The weight calculated.	repeated

Treasury.MinerReElectionInformation

Field	Туре	Description	Label
contin-	MinerReElectionInforma-	The reappointment informa-	re-
ual_appointment_times	tion.ContinualAppointmentTimesEntry	tion for miner.	peated

Treasury. Miner Re Election Information. Continual Appointment Times Entry

Field	Type	Description	Label
key	string		
value	int64		

Treasury.MinerRewardWeightProportion

Field	Туре	Description	La-
			bel
ba-	SchemeProportion-	The proportion of the basic income of the	
sic_miner_reward_proportion_info	Info	miner.	
votes_weight_reward_proportion_in	f & chemeProportion-	The proportion of the vote of the miner.	
	Info		
re_election_reward_proportion_info	SchemeProportion-	The proportion of the reappointment of the	
	Info	miner.	

Treasury.MinerRewardWeightSetting

Field	Type	Description	Label
basic_miner_reward_weight	int32	The dividend weight of the basic income of the miner.	
votes_weight_reward_weight	int32	The dividend weight of the vote of the miner.	
re_election_reward_weight	int32	The dividend weight of the reappointment of the miner.	

Treasury.RecordMinerReplacementInput

Field	Type	Description	Label
old_pubkey	string		
new_pubkey	string		
current_term_number	int64		

Treasury.SchemeProportionInfo

Field	Туре	Description	Label
scheme_id	aelf.Hash	The scheme id.	
proportion	int32	Dividend weight percentage.	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	
method_name	string	The name of the method to be charged.	
fees MethodFee		List of fees to be charged.	repeated
is_size_fee_free bool		Optional based on the implementation of SetMethodFee method.	

AEIf.Standards.ACS10

acs10.Dividends

Field	Туре	Description	Label
value	Dividends.ValueEntry	The dividends, symbol -> amount.	repeated

acs10.Dividends.ValueEntry

Field	Type	Description	Label
key	string		
value	int64		

acs10.DonateInput

Field	Type	Description	Label
symbol	string	The token symbol to donate.	
amount	int64	The amount to donate.	

acs10.DonationReceived

Field	Туре	Description	Label
from	aelf.Address	The address of donors.	
pool_contract	aelf.Address	The address of dividend pool.	
symbol	string	The token symbol Donated.	
amount	int64	The amount Donated.	

acs10.ReleaseInput

Field	Type	Description	Label
period_number	int64	The period number to release.	

acs10.SymbolList

Field	Туре	Description	Label
value	string	The token symbol list.	repeated

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Туре	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label	
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated	

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Туре	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n <i>im163</i> 6	rThe height of the referenced block hash.	
ref_block_	plogrifiess	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Туре	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	[
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_number The height of the block hat packages the transaction.			
block_hathash The hash of the block hat packages the transaction.			
error string Failed execution error message.			

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.11 AEIf.Contracts.Vote

Vote contract.

The Vote contract is an abstract layer for voting. Developers implement concrete voting activities by calling this contract.

Implement AElf Standards ACS1.

20.11.1 Contract Methods

Method	Request Type	Response	Description
Name		Туре	·
Register	Vote.VotingRegisterI	n gw togle.protobuf.	Example a voting activity.
Vote	Vote.VoteInput	google.protobuf.	EnApter successfully creating a voting activity, others are
			able to vote.
Withdraw	Vote.WithdrawInput	google.protobuf.	Entry of the can withdraw the token after the lock time.
TakeSnapshot	Vote.TakeSnapshotIr	p gø ogle.protobuf.	Estapore the result of the specified number of votes and gen-
			erates a new round votes.
AddOption	Vote.AddOptionInpu	t google.protobuf.	EnApty an option to a voting activity.
RemoveOp-	Vote.RemoveOption1	n ga togle.protobuf.	ERPMOVE an option from a voting activity.
tion			
AddOptions	Vote.AddOptionsInp	utgoogle.protobuf.	EnApte multiple options to a voting activity.
RemoveOp-	Vote.RemoveOptions	Ingonotgle.protobuf.	ERPMOVE multiple options from a voting activity.
tions			
GetVotingItem	Vote.GetVotingItemI	n Mot te.VotingItem	Get a voting activity information.
GetVotingRe-	Vote.GetVotingResul	t IMpte t.VotingResu	t Get a voting result according to the provided voting ac-
sult			tivity id and snapshot number.
GetLatestVot-	aelf.Hash	Vote.VotingResu	t Gets the latest result according to the voting activity id.
ingResult			
GetVotin-	aelf.Hash	Vote.VotingReco	dGet the voting record according to vote id.
gRecord			
GetVotin-	Vote.GetVotingRecor	rd MnpM otingReco	dGet the voting record according to vote ids.
gRecords			
GetVotedItems	aelf.Address	Vote.VotedItems	Get all voted information according to voter address.
GetVotingIds	Vote.GetVotingIdsIn	pu l tote.VotedIds	Get the vote ids according to voting activity id.

AEIf.Standards.ACS1

Method Name	Request Type	Response	Description
		Туре	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptine method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Exhapming the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ag Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.Ei	n A tothorityInfo	Query the method fee controller.
FeeController			

20.11.2 Contract Types

AEIf.Contracts.Vote

Vote.AddOptionInput

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
option	string	The new option to add.	

Vote.AddOptionsInput

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
options	string	The new options to add.	repeated

Vote.GetVotingIdsInput

Field	Туре	Description	Label
voter	aelf.Address	The address of voter.	
voting_item_id	aelf.Hash	The voting activity id.	

Vote.GetVotingItemInput

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	

Vote.GetVotingRecordsInput

Field	Туре	Description	Label
ids	aelf.Hash	The vote ids.	repeated

Vote.GetVotingResultInput

Field	Type	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
snapshot_number	int64	The snapshot number.	

Vote.RemoveOptionInput

Field	Type	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
option	string	The option to remove.	

Vote.RemoveOptionsInput

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
options	string	The options to remove.	repeated

Vote.TakeSnapshotInput

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
snapshot_number	int64	The snapshot number to take.	

Vote.VoteInput

Field	Type	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
voter	aelf.Address	The address of voter.	
amount	int64	The amount of vote.	
option	string	The option to vote.	
vote_id	aelf.Hash	The vote id.	
is_change_target	bool	Whether vote others.	

Vote.Voted

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
voter	aelf.Address	The address of voter.	
snapshot_number	int64	The snapshot number.	
amount	int64	The amount of vote.	
vote_timestamp	google.protobuf.Timestamp	The time of vote.	
option	string	The option voted.	
vote_id	aelf.Hash	The vote id.	

Vote.VotedIds

Field	Туре	Description	Label
active_votes	aelf.Hash	The active vote ids.	repeated
withdrawn_votes	aelf.Hash	The withdrawn vote ids.	repeated

Vote.VotedItems

Field	Туре	Description	Label
voted_item_vote_ids	VotedItems.VotedItemVoteIdsEntry	The voted ids.	repeated

Vote.VotedItems.VotedItemVoteldsEntry

Field	Туре	Description	Label
key	string		
value	VotedIds		

Vote.VotingItem

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
accepted_currency	string	The token symbol which will be ac-	
		cepted.	
is_lock_token	bool	Whether the vote will lock token.	
current_snapshot_number	int64	The current snapshot number.	
total_snapshot_number	int64	The total snapshot number.	
options	string	The list of options.	re-
			peated
register_timestamp	google.protobuf.Timestam	The register time of the voting activity.	
start_timestamp	google.protobuf.Timestam	The start time of the voting.	
end_timestamp		The end time of the voting.	
cur-	google.protobuf.Timestam	The start time of current round of the vot-	
rent_snapshot_start_timestamp		ing.	
sponsor	aelf.Address	The sponsor address of the voting activ-	
		ity.	

Vote.VotingItemRegistered

Field	Туре	Description	La-
			bel
voting_item_id	aelf.Hash	The voting activity id.	
accepted_currency	string	The token symbol which will be accepted.	
is_lock_token	bool	Whether the vote will lock token.	
current_snapshot_number	int64	The current snapshot number.	
total_snapshot_number	int64	The total number of snapshots of the vote.	
register_timestamp	google.protobuf.Timestamp	The register time of the voting activity.	
start_timestamp	google.protobuf.Timestamp	The start time of the voting.	
end_timestamp	google.protobuf.Timestamp	The end time of the voting.	
cur-	google.protobuf.Timestamp	The start time of current round of the vot-	
rent_snapshot_start_timestamp		ing.	
sponsor	aelf.Address	The sponsor address of the voting activity.	

Vote.VotingRecord

Field	Type	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
voter	aelf.Address	The address of voter.	
snapshot_number	int64	The snapshot number.	
amount	int64	The amount of vote.	
withdraw_timestamp	google.protobuf.Timestamp	The time of withdraw.	
vote_timestamp	google.protobuf.Timestamp	The time of vote.	
is_withdrawn	bool	Whether the vote had been withdrawn.	
option	string	The option voted.	
is_change_target	bool	Whether vote others.	

Vote.VotingRecords

Field	Туре	Description	Label
records	VotingRecord	The voting records.	repeated

Vote.VotingRegisterInput

Field	Type	Description	Label
start_timestamp	google.protobuf.Timestamp	The start time of the voting.	
end_timestamp	google.protobuf.Timestamp	The end time of the voting.	
accepted_currency	string	The token symbol which will be accepted.	
is_lock_token	bool	Whether the vote will lock token.	
total_snapshot_number	int64	The total number of snapshots of the vote.	
options	string	The list of options.	repeated

Vote.VotingResult

Field	Туре	Description	Label
voting_item_id	aelf.Hash	The voting activity id.	
results	VotingRe-	The voting result, option -> amount of votes,	re-
	sult.ResultsEntry		peated
snapshot_number	int64	The snapshot number.	
voters_count	int64	The total number of voters.	
snap-	google.protobuf.Timestam	<i>p</i> The start time of this snapshot.	
shot_start_timestamp			
snap-	google.protobuf.Timestam	<i>p</i> The end time of this snapshot.	
shot_end_timestamp			
votes_amount	int64	Total votes received during the process of this	
		snapshot.	

Vote.VotingResult.ResultsEntry

Field	Type	Description	Label
key	string		
value	int64		

Vote.WithdrawInput

Field	Туре	Description	Label
vote_id	aelf.Hash	The vote id.	

Vote.Withdrawn

Field	Туре	Description	Label
vote_id	aelf.Hash	The vote id.

block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hslash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.13 AEIf.Contracts.Economic

Economic contract.

The Economic contract establishes the economic system of the AEIf. When the block chain starts to work, this contract will initialize other contracts related to economic activities.

Implement AEIf Standards ACS1.

20.13.1 Contract Methods

Method	Request	Re-	Description
Name	Type	sponse	
		Type	
Issue-	Eco-	google.pro	ot Only Exercise Contract is able to issue the native token.
Native-	nomic.IssueNat	iveTokenInp	put
Token			
Ini-	Eco-	google.pro	of by the bufil Emittigalize other contracts related to economic activities (For instance,
tialEco-	nomic.InitialEc	onomicSyst	enatespher the native token). This transaction only can be send once because
nomic-			after the first sending, its state will be set to initialized.
System			

AEIf.Standards.ACS1

Method Name	Request Type	Response	Description
		Туре	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptive method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Emprage the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ng Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.E	m A tothorityInfo	Query the method fee controller.
FeeController			

20.13.2 Contract Types

AEIf.Contracts.Economic

Economic.InitialEconomicSystemInput

Field	Type	Description	La-
			bel
native_token_symbol	string	The native token symbol.	
native_token_name	string	The native token name.	
native_token_total_supply	int64	The native token total supply.	
native_token_decimals	int32	The accuracy of the native token.	
is_native_token_burnable	bool	It indicates if the token is burnable.	
mining_reward_total_amount	int64	It determines how much native token is used to reward the min-	
		ers.	
transac-	int64	todo: remove unused fields	
tion_size_fee_unit_price			

Economic.lssueNativeTokenInput

Field	Туре	Description	Label
amount	int64	The amount of token.	
memo	string	The memo.	
to	aelf.Address	The recipient of the token.	

Economic.IssueResourceTokenInput

Field	Туре	Description	Label
symbol	string	The symbol of resource token.	
amount	int64	The amount of resource token.	
memo	string	The memo.	
to	aelf.Address	The recipient of the token.	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees MethodFee		List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Type	Description	
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n imm 034	rThe height of the referenced block hash.	
ref_block_	pberties	The first four bytes of the referenced block hash.	
method_na	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

aelf.TransactionExecutingStateSet

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hdash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IO	Transaction validation failed.

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

20.14 AEIf.Contracts.TokenConverter

TokenConvert contract.

Using this contract can build a connection between the base token and other tokens created on the chain. After building the connection, users can trade tokens with the Bancor model. You can find the detail information about Bancor in AEIf Economic System White Paper.

Implement AEIf Standards ACS1.

20.14.1 Contract Methods

Method Name	Request Type	Response Type	Description
Initialize	TokenCon-	google.protobuf	Elmitivalize TokenConvert contract.
	verter.InitializeInput		
SetConnector	TokenCon-	google.protobuf	Empty
	verter.Connector		
Buy	TokenCon-	google.protobuf	Empter establishing bancor model of token and base to-
	verter.BuyInput		ken, you can buy token through this method.
Sell	TokenCon-	google.protobuf	Empter establishing bancor model of token and base to-
	verter.SellInput		ken, you can sell token through this method.
SetFeeRate	google.protobuf.Strin	g Yadag le.protobuf	Espetishe fee rate for buy/sell (fee amount = cost * feeR-
			ate).
UpdateConnec-	TokenCon-	google.protobuf	Electronic calling the EnableConnector, the connector
tor	verter.Connector		controller can update the pair connector through this
			method.
AddPairConnec-	TokenCon-	google.protobuf	Employa pair connector for new token and the base to-
tor	verter.PairConnector	Param	ken.
EnableConnec-	TokenCon-	google.protobuf	Empter adding a pair, you need to call this method to
tor	verter.ToBeConnected		enable it before buy and sell token.
ChangeConnec-	AuthorityInfo	google.protobuf	ESeptethe governance authority information for Token-
torController			Convert contract.
GetPairConnec-	TokenCon-	TokenCon-	Query the pair connector according to token symbol.
tor	verter.TokenSymbol	verter.PairConn	ector
GetFeeRate	google.protobuf.Emp	y google.protobuf	SQingry/athre fee rate for buy/sell.
GetBaseToken-	google.protobuf.Emp	y TokenCon-	Query the symbol of base token.
Symbol		verter.TokenSym	bol
GetNeededDe-	TokenCon-	TokenCon-	Query how much the base token need be deposited
posit	verter.ToBeConnected	lTodadaInD@positIn	fobefore enabling the connector.
GetDepositCon-	google.protobuf.Strin	g Yadag le.protobuf	In the base token have been deposited.
nectorBalance			
GetController-	google.protobuf.Emp	yAuthorityInfo	Query the governance authority information for To-
ForManageCon-			kenConvert contract.
nector			
IsSymbolAble-	google.protobuf.Strin	g Vadag le.protobuf	BQulðúyluvehether the token can be sold.
ToSell			

AEIf.Standards.ACS1

Method Name	Request Type	Response	Description
		Type	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptine method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Exhapming the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ag Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.E	n A tothorityInfo	Query the method fee controller.
FeeController			

20.14.2 Contract Types

AEIf.Contracts.TokenConverter

TokenConverter.BuyInput

Field	Type	Description	La-
			bel
symbol	string	The token symbol you want to buy.	
amount	int64	The amount you want to buy.	
pay_limit	int64	Limit of cost. If the token required for buy exceeds this value, the buy will be abandoned.	
		And 0 is no limit.	

TokenConverter.Connector

Field	Туре	Description	La-
			bel
symbol	9	The token symbol.	
virtual_balance	int64	The virtual balance for base token.	
weight	string	The calculated weight value for this Connector.	
is_virtual_balance_	en babile c	Whether to use Virtual Balance.	
is_purchase_enable	d <i>bool</i>	Whether the connector is enabled.	
related_symbol	string	Indicates its related connector, the pair connector includes a new created token	
		connector and the base token connector.	
is_deposit_account	bool	Indicates if the connector is base token connector.	

TokenConverter.DepositInfo

Field	Type	Description	Label
need_amount	int64	How much more base Token is needed as the deposit.	
amount_out_of_token_convert	int64	How many tokens are not on the TokenConvert address.	

TokenConverter.InitializeInput

Field	Туре	Description	Label
base_token_symbol	string	Base token symbol, default is the native token symbol.	
fee_rate	string	The fee rate for buy/sell.	
connectors	Connector	The default added connectors.	repeated

TokenConverter.PairConnector

Field	Туре	Description	Label
resource_connector	Connector	The connector of the specified token.	
deposit_connector	Connector	The related connector.	

TokenConverter.PairConnectorParam

Field	Туре	Description	Label
resource_connector_symbol	string	The token symbol.	
resource_weight	string	The weight value of this token in the Bancor model.	
native_virtual_balance	int64	This token corresponds to the value of base token.	
native_weight	string	The weight value of base token in Bancor model.	

TokenConverter.SellInput

Field	Туре	Description	La-
			bel
symbol	string	The token symbol you want to sell.	
amount	int64	The amount you want to sell.	
re-	int64	Limits on tokens obtained by selling. If the token obtained is less than this value, the	
ceive_limi	t	sale will be abandoned. And 0 is no limit.	

TokenConverter.ToBeConnectedTokenInfo

Field	Type	Description	La-
			bel
token_symbol	string	The token symbol.	
amount_to_token_convert	int64	Specifies the number of tokens to convert to the TokenConvert con-	
		tract.	

TokenConverter.TokenBought

Field	Type	Description	Label
symbol	string	The token symbol bought.	
bought_amount	int64	The amount bought.	
base_amount	int64	The total cost of the base token.	
fee_amount	int64	The fee amount.	

TokenConverter.TokenSold

Field	Туре	Description	Label
symbol	string	The token symbol sold.	
sold_amount	int64	The amount sold.	
base_amount	int64	The total received of the base token.	
fee_amount	int64	The fee amount.	

TokenConverter.TokenSymbol

Field	Туре	Description	Label
symbol	string	The token symbol.	

AEIf.Standards.ACS1

acs1.MethodFee

Field	Туре	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AEIf.Types

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	n imm otek	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_n	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

aelf.TransactionExecutingStateSet

Field	Type	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

CHAPTER 21

Acs Introduction

21.1 ACS0 - Contract Deployment Standard

ACS0 is used to manage the deployment and update of contracts.

21.1.1 Interface

The contract inherited from ACS0 need implement the following interfaces:

Methods

Method Name	Request Type	Response Type	Description
DeploySystemS-	acs0.SystemContra	ct i Delfillool <mark>drens</mark> Inj	Deploy a system smart contract on chain and return the
martContract			address of the system contract deployed.
DeploySmartCon-	acs0.ContractDeple	ymeefnAddruss	Deploy a smart contract on chain and return the address
tract			of the contract deployed.
UpdateSmartCon-	acs0.ContractUpda	te daļ fu A ddress	Update a smart contract on chain.
tract			
ProposeNewCon-	acs0.ContractDeple	y weefiHaph t	Create a proposal to deploy a new contract and returns
tract			the id of the proposed contract.
ProposeContract-	acs0.ContractCode	Chelfk Hqxh t	Create a proposal to check the code of a contract and
CodeCheck			return the id of the proposed contract.
ProposeUpdate-	acs0.ContractUpda	te daļ fiHash	Create a proposal to update the specified contract and
Contract		_	return the id of the proposed contract.
ReleaseAp-	acs0.ReleaseContro	ıc gloopalı e.protobi	f. Relpase the contract proposal which has been approved.
provedContract			
ReleaseC-	acs0.ReleaseContro	ıc gloopalı e.protobi	f. Relpase the proposal which has passed the code check.
odeChecked-			
Contract			
ValidateSystem-	acs0.ValidateSystem	n Gonote lec pArdtdolen	Explicit whether the input system contract exists.
ContractAddress			
SetContractPro-	google.protobuf.Bo	ol ¥alış le.protobi	f. Extratythority of contract deployment.
poserRequired-			
State

Types

acs0.CodeCheckRequired

Field	Туре	Description	Label
code	bytes	The byte array of the contract code.	
proposed_contract_input_hash	aelf.Hash	The id of the proposed contract.	
category	sint32	The category of contract code(0: C#).	
is_system_contract	bool	Indicates if the contract is the system contract.	

acs0.CodeUpdated

Field	Туре	Description	Label
address	aelf.Address	The address of the updated contract.	
old_code_hash	aelf.Hash	The byte array of the old contract code.	
new_code_hash	aelf.Hash	The byte array of the new contract code.	
version	int32	The version of the current contract.	

acs 0. Contract Code Check Input

Field	Type	Description	La-
			bel
contract_input	bytes	The byte array of the contract code to be checked.	
is_contract_deployment	bool	Whether the input contract is to be deployed or updated.	
code_check_release_methodring		Method to call after code check complete(DeploySmartContract or	
		UpdateSmartContract).	
pro-	aelf.Hasl	The id of the proposed contract.	
posed_contract_input_hash			
category	sint32	The category of contract code(0: C#).	
is_system_contract	bool	Indicates if the contract is the system contract.	

acs0.ContractDeployed

Field	Type	Description	Label
author	aelf.Address	The author of the contract, this is the person who deployed the contract.	
code_hash	aelf.Hash	The hash of the contract code.	
address	aelf.Address	The address of the contract.	
version	int32	The version of the current contract.	
Name	aelf.Hash	The name of the contract. It has to be unique.	

acs0.ContractDeploymentInput

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	

acs0.ContractInfo

Field	Type	Description	La-
			bel
serial_number	int64	The serial number of the contract.	
author	aelf.Address	The author of the contract, this is the person who deployed the con-	
		tract.	
category	sint32	The category of contract code(0: C#).	
code_hash	aelf.Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

acs0.ContractProposed

Field	Type	Description	Label
proposed_contract_input_hash	aelf.Hash	The id of the proposed contract.	

acs0.ContractUpdateInput

Field	Type	Description	Label
address	aelf.Address	The contract address that needs to be updated.	
code	bytes	The byte array of the new contract code.	

acs0.ReleaseContractInput

Field	Туре	Description	Label
proposal_id	aelf.Hash	The hash of the proposal.	
proposed_contract_input_hash	aelf.Hash	The id of the proposed contract.	

acs0.SystemContractDeploymentInput

Field	Туре	Description	La-
			bel
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
name	aelf.Hash	The name of the contract. It has to be unique.	
transac-	SystemContractDeploymentIn-	An initial list of transactions for the system contract,	
tion_method_ca	al <u>þ</u> u ltss fystemTransactionMethodCal	Linshich is executed in sequence when the contract is de-	
		ployed.	

acs 0. System Contract Deployment Input. System Transaction Method Call

Field	Туре	Description	Label
method_name	string	The method name of system transaction.	
params	bytes	The params of system transaction method.	

acs 0. System Contract Deployment Input. System Transaction Method Call List

Field	Туре	Description	Label
value	SystemContractDeploymentIn-	The list of system transac-	re-
	put. System Transaction Method Call	tions.	peated

acs 0. Validate System Contract Address Input

Field	Type	Description	Label
system_contract_hash_name	aelf.Hash	The name hash of the contract.	
address	aelf.Address	The address of the contract.	

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Туре	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Туре	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	n imm otek	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_n	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Type	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hdash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IO	Transaction validation failed.

21.1.2 Example

ACSO declares methods for the scenes about contract deployment and update. AEIf provides the implementation for ACSO, Genesis Contract. You can refer to the implementation of the *Genesis contract api*.

21.2 ACS1 - Transaction Fee Standard

ACS1 is used to manage the transfer fee.

21.2.1 Interface

The contract inherited from ACS1 need implement the APIs below:

Methods

Method Name	Request Type	Response	Description
		Type	
SetMethodFee	acs1.MethodFees	google.protobu	f. Exerptine method fees for the specified method. Note that
			this will override all fees of the method.
ChangeMethod-	AuthorityInfo	google.protobu	f. Exhapming the method fee controller, the default is parlia-
FeeController			ment and default organization.
GetMethodFee	google.protobuf.St	ri ag Ma Me thodFe	e.Query method fee information by method name.
GetMethod-	google.protobuf.E	m Atvy thorityInfo	Query the method fee controller.
FeeController			

Types

acs1.MethodFee

Field	Type	Description	Label
symbol	string	The token symbol of the method fee.	
basic_fee	int64	The amount of fees to be charged.	

acs1.MethodFees

Field	Туре	Description	Label
method_name	string	The name of the method to be charged.	
fees	MethodFee	List of fees to be charged.	repeated
is_size_fee_free	bool	Optional based on the implementation of SetMethodFee method.	

AuthorityInfo

Field	Туре	Description	Label
contract_address	aelf.Address	The contract address of the controller.	
owner_address	aelf.Address	The address of the owner of the contract.	

Attention: just the system contract on main chain is able to implement acs1.

21.2.2 Usage

On AEIf, a pre-transaction is generated by pre-plugin FeeChargePreExecutionPlugin before the transaction main processing. It is used to charge the transaction fee.

The generated transaction's method is ChargeTransactionFees. The implementation is roughly like that (part of the code is omitted):

```
/// <summary>
/// Related transactions will be generated by acs1 pre-plugin service,
/// and will be executed before the origin transaction.
/// </summary>
/// <param name="input"></param>
/// <returns></returns>
public override BoolValue ChargeTransactionFees(ChargeTransactionFeesInput input)
   // Record tx fee bill during current charging process.
   var bill = new TransactionFeeBill();
   var fromAddress = Context.Sender;
   var methodFees = Context.Call<MethodFees>(input.ContractAddress,__
→nameof(GetMethodFee),
        new StringValue {Value = input.MethodName});
    var successToChargeBaseFee = true;
    if (methodFees != null && methodFees.Fees.Any())
        successToChargeBaseFee = ChargeBaseFee (GetBaseFeeDictionary (methodFees), ref_
→bill);
    var successToChargeSizeFee = true;
    if (!IsMethodFeeSetToZero(methodFees))
        // Then also do not charge size fee.
        successToChargeSizeFee = ChargeSizeFee(input, ref bill);
    // Update balances.
    foreach (var tokenToAmount in bill.FeesMap)
        ModifyBalance(fromAddress, tokenToAmount.Key, -tokenToAmount.Value);
        Context.Fire(new TransactionFeeCharged
            Symbol = tokenToAmount.Key,
            Amount = tokenToAmount.Value
        });
        if (tokenToAmount.Value == 0)
            //Context.LogDebug(() => $"Maybe incorrect charged tx fee of
 +{tokenToAmount.Key}: it's 0.");
                                                                          (continues on next page)
```

(continued from previous page)

```
}
}
return new BoolValue {Value = successToChargeBaseFee && successToChargeSizeFee};
}
```

In this method, the transaction fee consists of two parts:

- 1. The system calls GetMethodFee(line 15) to get the transacion fee you should pay. Then, it will check whether your balance is enough. If your balance is sufficient, the fee will be signed in the bill (variant bill). If not, your transaction will be rejected.
- 2. If the method fee is not set to 0 by the contract developer, the system will charge size fee. (the size if calculate by the parameter's size)

After charging successfully, an TransactionFeeCharged event is thrown, and the balance of the sender is modified.

The TransactionFeeCharged event will be captured and processed on the chain to calculate the total amount of transaction fees charged in the block. In the next block, the 10% of the transaction fee charged in this block is destroyed, the remaining 90% flows to dividend pool on the main chain, and is transferred to the FeeReciever on the side chain. The code is:

```
/// <summarv>
/// Burn 10% of tx fees.
/// If Side Chain didn't set FeeReceiver, burn all.
/// </summary>
/// <param name="symbol"></param>
/// <param name="totalAmount"></param>
private void TransferTransactionFeesToFeeReceiver(string symbol, long totalAmount)
    Context.LogDebug(() => "Transfer transaction fee to receiver.");
    if (totalAmount <= 0) return;</pre>
    var burnAmount = totalAmount.Div(10);
    if (burnAmount > 0)
        Context.SendInline(Context.Self, nameof(Burn), new BurnInput
            Symbol = symbol,
            Amount = burnAmount
    var transferAmount = totalAmount.Sub(burnAmount);
    if (transferAmount == 0)
        return:
    var treasuryContractAddress =
        {\tt Context.GetContractAddressByName}~({\tt SmartContractConstants.}
→TreasuryContractSystemName);
    if ( treasuryContractAddress!= null)
        // Main chain would donate tx fees to dividend pool.
        if (State.DividendPoolContract.Value == null)
            State.DividendPoolContract.Value = treasuryContractAddress;
        State.DividendPoolContract.Donate.Send(new DonateInput
            Symbol = symbol,
            Amount = transferAmount
        });
    else
```

(continues on next page)

(continued from previous page)

```
{
    if (State.FeeReceiver.Value != null)
    {
        Context.SendInline(Context.Self, nameof(Transfer), new TransferInput
        {
            To = State.FeeReceiver.Value,
                Symbol = symbol,
                 Amount = transferAmount,
        });
    }
    else
    {
        // Burn all!
        Context.SendInline(Context.Self, nameof(Burn), new BurnInput
        {
            Symbol = symbol,
                 Amount = transferAmount
        });
    }
}
```

In this way, AEIf charges the transaction fee via the GetMethodFee provided by ACS1, and the other three methods are used to help with the implementations of GetMethodFee.

21.2.3 Implementation

The easiest way to do this is to just implement the method GetMethodFee.

If there are Foo1, Foo2, Bar1 and Bar2 methods related to business logic in a contract, they are priced as 1, 1, 2, 2 ELF respectively, and the transaction fees of these four methods will not be easily modified later, they can be implemented as follows:

(continues on next page)

(continued from previous page)

```
Fees =
{
    new MethodFee
    {
        BasicFee = 2_00000000,
        Symbol = Context.Variables.NativeSymbol
    }
}
return new MethodFees();
}
```

This implementation can modify the transaction fee only by upgrading the contract, without implementing the other three interfaces.

A more recommended implementation needs to define an MappedState in the State file for the contract:

```
public MappedState<string, MethodFees> TransactionFees { get; set; }
```

Modify the TransactionFees data structure in the SetMethodFee method, and return the value in the GetMethodFee method.

In this solution, the implementation of GetMethodFee is very easy:

```
public override MethodFees GetMethodFee(StringValue input)
   return State.TransactionFees[input.Value];
}
```

The implementation of SetMethodFee requires the addition of permission management, since contract developers don't want the transaction fees of their contract methods to be arbitrarily modified by others.

Referring to the MultiToken contract, it can be implemented as follows:

Firstly, define a SingletonState with type AuthorityInfo(in authority_info.proto)

```
public SingletonState<AuthorityInfo> MethodFeeController { get; set; }
```

Then, check the sender's right by comparing its address with owner.

AssertValidToken checks if the token symbol exists, and the BasicFee is reasonable.

The permission check code is in the lines 8 and 9, and RequiredMethodFeeControllerSet prevents the permission is not set before.

If permissions are not set, the SetMethodFee method can only be called by the default address of the Parliament organization. If a method is sent through this organization, it means that two-thirds of the block producers have agreed to the proposal.

```
private void RequiredMethodFeeControllerSet()
{
    if (State.MethodFeeController.Value != null) return;
    if (State.ParliamentContract.Value == null)
    {
        State.ParliamentContract.Value = Context.
        GetContractAddressByName(SmartContractConstants.ParliamentContractSystemName);
    }
    var defaultAuthority = new AuthorityInfo();
    // Parliament Auth Contract maybe not deployed.
    if (State.ParliamentContract.Value != null)
    {
        defaultAuthority.OwnerAddress = State.ParliamentContract.
        GetDefaultOrganizationAddress.Call(new Empty());
        defaultAuthority.ContractAddress = State.ParliamentContract.Value;
    }
    State.MethodFeeController.Value = defaultAuthority;
}
```

Of course, the authority of SetMethodFee can also be changed, provided that the transaction to modify the authority is sent from the default address of the Parliament contract:

```
public override Empty ChangeMethodFeeController(AuthorityInfo input)
{
    RequiredMethodFeeControllerSet();
    AssertSenderAddressWith(State.MethodFeeController.Value.OwnerAddress);
    var organizationExist = CheckOrganizationExist(input);
    Assert(organizationExist, "Invalid authority input.");
    State.MethodFeeController.Value = input;
    return new Empty();
}
```

The implementation of GetMethodFeeController is also very easy

```
public override AuthorityInfo GetMethodFeeController(Empty input)
{
    RequiredMethodFeeControllerSet();
    return State.MethodFeeController.Value;
}
```

Above all, these are the two ways to implement acs1. Mostly, implementations will use a mixture of the two: part of methods' fee is set with a fixed value, the other part of method is not to set method fee.

21.2.4 Test

Create ACS1's Stub, and call GetMethodFee and GetMethodFeeController to check if the return value is expected.

21.2.5 Example

All AEIf system contracts implement ACS1, which can be used as a reference.

21.3 ACS2 - Parallel Execution Standard

ACS2 is used to provide information for parallel execution of transactions.

21.3.1 Interface

A contract that inherits ACS2 only needs to implement one method:

Methods

Method	Request	Response	Description
Name	Туре	Type	
GetResource-	aelf.Transaction	n acs2.ResourceInf	Gets the resource information that the transaction execution
Info			depends on.

Types

acs2.ResourceInfo

Field	Туре	Description	Label
write_paths	aelf.ScopedStatePath	The state path that depends on when writing.	repeated
read_paths	aelf.ScopedStatePath	The state path that depends on when reading.	repeated
non_parallelizable	bool	Whether the transaction is not executed in parallel.	

aelf.Address

Field	Туре	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

ſ	Field	Type	Description	Label
	value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Туре	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n <i>im163</i> 6	rThe height of the referenced block hash.	
ref_block_	plogrifiess	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> tklash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num- ber	Description
	Dei	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	E IØ	Transaction validation failed.

21.3.2 Usage

AEIf uses the key-value database to store data. For the data generated during the contract execution, a mechanism called **State Path** is used to determine the key of the data.

For example Token contract defines a property,

```
public MappedState<Address, string, long> Balances { get; set; }
```

it can be used to access, modify balance.

Assuming that the address of the Token contract is Nmjj7noTpMqZ522j76SDsFLhiKkThv1u3d4TxqJMD8v89tWmE. If you want to know the balance of the address 2EM5uV6bSJh6xJfZTUa1pZpYsYcCUAdPvZvFUJzMDJEx3rbioz, you can directly use this key to access redis / ssdb to get its value.

```
Nmjj7noTpMqZ522j76SDsFLhiKkThv1u3d4TxqJMD8v89tWmE/Balances/

2EM5uV6bSJh6xJfZTUa1pZpYsYcCUAdPvZvFUJzMDJEx3rbioz/ELF
```

On AEIf, the implementation of parallel transaction execution is also based on the key, developers need to provide a method may access to the StatePath, then the corresponding transactions will be properly grouped before executing: if the two methods do not access the same StatePath, then you can safely place them in different groups.

Attention: The transaction will be canceled and labeled to "can not be groupped" when the StatePath mismatchs the method.

If you are interested in the logic, you can view the code ITransactionGrouper, as well as IParallelTransactionExecutingService .

21.3.3 Implementation

Token contract, as an example, the core logic of method Transfer is to modify the balance of address. It accesses the balances property mentioned above twice.

At this point, we need to notify ITransactionGrouper via the GetResourceInfo method of the key of the ELF balance of address A and address B:

The GetPath forms a ScopedStatePath from several pieces of data that make up the key:

```
Parts =
      {
            parts
            }
        }
}
```

21.3.4 Test

You can construct two transactions, and the transactions are passed directly to an implementation instance of ITransactionGrouper, and the GroupAsync method is used to see whether the two transactions are parallel.

We prepare two stubs that implement the ACS2 contract with different addresses to simulate the Transfer:

```
var keyPair1 = SampleECKeyPairs.KeyPairs[0];
var acs2DemoContractStub1 = GetACS2DemoContractStub(keyPair1);
var keyPair2 = SampleECKeyPairs.KeyPairs[1];
var acs2DemoContractStub2 = GetACS2DemoContractStub(keyPair2);
```

Then take out some services and data needed for testing from Application:

Finally, check it via transactionGrouper:

```
// Situation can be parallel executed.
  var groupedTransactions = await transactionGrouper.GroupAsync(new ChainContext
     BlockHash = chain.BestChainHash,
     BlockHeight = chain.BestChainHeight
  }, new List<Transaction>
     To = Address.FromPublicKey(SampleECKeyPairs.KeyPairs[2].PublicKey),
        Symbol = "ELF",
        Amount = 1
     }),
     To = Address.FromPublicKey(SampleECKeyPairs.KeyPairs[3].PublicKey),
         Symbol = "ELF",
         Amount = 1
     }),
  groupedTransactions.Parallelizables.Count.ShouldBe(2);
// Situation cannot.
```

```
var groupedTransactions = await transactionGrouper.GroupAsync(new ChainContext
{
    BlockHash = chain.BestChainHash,
    BlockHeight = chain.BestChainHeight
}, new List<Transaction>
{
    acs2DemoContractStubl.TransferCredits.GetTransaction(new TransferCreditsInput
    {
        To = Address.FromPublicKey(SampleECKeyPairs.KeyPairs[2].PublicKey),
            Symbol = "ELF",
        Amount = 1
    }),
    acs2DemoContractStub2.TransferCredits.GetTransaction(new TransferCreditsInput
    {
        To = Address.FromPublicKey(SampleECKeyPairs.KeyPairs[2].PublicKey),
            Symbol = "ELF",
            Amount = 1
    }),
    });
    groupedTransactions.Parallelizables.Count.ShouldBe(1);
}
```

21.3.5 Example

You can refer to the implementation of the MultiToken contract for GetResourceInfo. Noting that for the ResourceInfo provided by the method Transfer, you need to consider charging a transaction fee in addition to the two keys mentioned in this article.

21.4 ACS3 - Contract Proposal Standard

ACS3 is suitable for the case that a method needs to be approved by multiple parties. At this time, you can consider using some of the interfaces provided by ACS3.

21.4.1 Interface

If you want multiple addresses vote to get agreement to do something, you can implement the following methods defined in ACS3:

Methods

Method	Request	Re-	Description
Name	Туре	sponse	
		Type	
CreatePro-	acs3.CreatePro	p oxedfIHpus h	Create a proposal for which organization members can vote. When the
posal			proposal is released, a transaction will be sent to the specified contract.
			Return id of the newly created proposal.
Approve	aelf.Hash		pt App Twep typroposal according to the proposal ID.
Reject	aelf.Hash		of Registraphyoposal according to the proposal ID.
Abstain	aelf.Hash		pt Alnstaim ptproposal according to the proposal ID.
Release	aelf.Hash	google.pre	pt Blank as mpt proposal according to the proposal ID and send a transaction
			to the specified contract.
ChangeOr-	acs3.ProposalR	el googT dy pe d	should be thresholds associated with proposals. All fields will be
ganization-			overwritten by the input value and this will affect all current propos-
Threshold			als of the organization. Note: only the organization can execute this
			through a proposal.
ChangeOr-	acs3.ProposerV	Vh gitælgikt .pre	pt Chapte white list of organization proposer. This method overrides
ganization-			the list of whitelisted proposers.

Types

acs 3. Create Proposal By System Contract Input

Field	Туре	Description	Label
proposal_input	CreateProposalInput	The parameters of creating proposal.	
origin_proposer	aelf.Address	The actor that trigger the call.	

acs3.CreateProposalInput

Field	Туре	Description	La- bel
con-	string	The name of the method to call after release.	
tract_method_nar	ne		
to_address	aelf.Address	The address of the contract to call after release.	
params	bytes	The parameter of the method to be called after the release.	
expired_time	google.protobuf.Ti	n Ashartipnestamp at which this proposal will expire.	
organiza-	aelf.Address	The address of the organization.	
tion_address			
pro-	string	Url is used for proposal describing.	
posal_description	_url		
token	aelf.Hash	The token is for proposal id generation and with this token, proposal	
		id can be calculated before proposing.	

acs3.OrganizationCreated

Field	Туре	Description	Label
organization_address	aelf.Address	The address of the created organization.	

acs3.OrganizationHashAddressPair

Field	Type	Description	Label
organization_hash	aelf.Hash	The id of organization.	
organization_address	aelf.Address	The address of organization.	

acs 3. Organization Threshold Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address	
proposer_release_threshold	ProposalReleaseThreshold	The new release threshold.	

acs 3. Organization White List Changed

Field	Туре	Description	Label
organization_address	aelf.Address	The organization address.	
proposer_white_list	ProposerWhiteList	The new proposer whitelist.	

acs3.ProposalCreated

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the created proposal.	
organization_address	aelf.Address	The organization address of the created proposal.	

acs3.ProposalOutput

Field	Туре	Description	La-
			bel
proposal_id	aelf.Hash	The id of the proposal.	
con-	string	The method that this proposal will call when being re-	
tract_method_name		leased.	
to_address	aelf.Address	The address of the target contract.	
params	bytes	The parameters of the release transaction.	
expired_time	google.protobuf.Timestamp The date at which this proposal will expire.		
organiza-	aelf.Address	The address of this proposals organization.	
tion_address			
proposer	aelf.Address	The address of the proposer of this proposal.	
to_be_released	bool	Indicates if this proposal is releasable.	
approval_count	int64	Approval count for this proposal.	
rejection_count	int64	Rejection count for this proposal.	
abstention_count	int64	Abstention count for this proposal.	

acs 3. Proposal Release Threshold

Field	Type	Description	Label
minimal_approval_threshold	int64	The value for the minimum approval threshold.	
maximal_rejection_threshold	int64	The value for the maximal rejection threshold.	
maximal_abstention_threshold	int64	The value for the maximal abstention threshold.	
minimal_vote_threshold	int64	The value for the minimal vote threshold.	

acs3.ProposalReleased

Field	Туре	Description	Label
proposal_id	aelf.Hash	The id of the released proposal.	
organization_address	aelf.Address	The organization address of the released proposal.	

acs 3. Proposer White List

Field	Туре	Description	Label
proposers	aelf.Address	The address of the proposers	repeated

acs3.ReceiptCreated

Field	Type	Description	Label
proposal_id	aelf.Hash	The id of the proposal.	
address	aelf.Address	The sender address.	
receipt_type	string	The type of receipt(Approve, Reject or Abstain).	
time	google.protobuf.Timestamp	The timestamp of this method call.	
organization_address	aelf.Address	The address of the organization.	

acs3.ValidateProposerInWhiteListInput

Field	Туре	Description	Label
proposer	aelf.Address	The address to search/check.	
organization_address	aelf.Address	The address of the organization.	

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf. Binary Merkle Tree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Type	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	category sint32 The category of contract code(0: C#)		
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	nimmotek	rThe height of the referenced block hash.	
ref_block_	plognes	The first four bytes of the referenced block hash.	
method_n	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

aelf. Transaction Executing State Set. Reads Entry

Field	Туре	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_id	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_ninttber The height of the block hat packages the transaction.			
block_hattash		The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name Num-		Description	
	ber		
NOT_EXISTED	0	The execution result of the transaction does not exist.	
PENDING	1	The transaction is in the transaction pool waiting to be packaged.	
FAILED	2	Transaction execution failed.	
MINED 3		The transaction was successfully executed and successfully packaged	
		into a block.	
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.	
PENDING_VALIDATION 5		The transaction is waiting for validation.	
NODE_VALIDATION_FAILEI		Transaction validation failed.	

21.4.2 Implementation

It is assumed here that there is only one organization in a contract, that is, there is no need to specifically define the Organization type. Since the organization is not explicitly declared and created, the organization's proposal whitelist does not exist. The process here is that the voter must use a certain token to vote.

For simplicity, only the core methods CreateProposal, Approve, Reject, Abstain, and Release are implemented here.

There are only two necessary State attributes:

```
public MappedState<Hash, ProposalInfo> Proposals { get; set; }
public SingletonState<ProposalReleaseThreshold> ProposalReleaseThreshold { get; set; }
```

The Proposals stores all proposal's information, and the ProposalReleaseThreshold is used to save the requirements that the contract needs to meet to release the proposal.

When the contract is initialized, the proposal release requirements should be set:

The requirement is at least one member who vote and at least one approval. Create proposal:

Vote:

```
public override Empty Abstain(Hash input)
{
    Charge();
    var proposal = State.Proposals[input];
    if (proposal == null)
    {
        throw new AssertionException("Proposal not found.");
    }
    proposal.Abstentions.Add(Context.Sender);
    State.Proposals[input] = proposal;
    return new Empty();
}
public override Empty Approve(Hash input)
{
    Charge();
    var proposal = State.Proposals[input];
    if (proposal == null)
    {
        throw new AssertionException("Proposal not found.");
    }
    proposal.Approvals.Add(Context.Sender);
```

```
State.Proposals[input] = proposal;
   return new Empty();
public override Empty Reject(Hash input)
   Charge();
   var proposal = State.Proposals[input];
   if (proposal == null)
       throw new AssertionException("Proposal not found.");
   proposal.Rejections.Add(Context.Sender);
   State.Proposals[input] = proposal;
   return new Empty();
private void Charge()
    State.TokenContract.TransferFrom.Send(new TransferFromInput
        From = Context.Sender,
        To = Context.Self,
        Symbol = Context.Variables.NativeSymbol,
        Amount = 1_00000000
    });
```

Release is just count the vote, here is a recommended implementation:

```
public override Empty Release(Hash input)
   var proposal = State.Proposals[input];
   if (proposal == null)
       throw new AssertionException("Proposal not found.");
   Assert(IsReleaseThresholdReached(proposal), "Didn't reach release threshold.");
   Context.SendInline(proposal.ToAddress, proposal.ContractMethodName, proposal.
→Params);
   return new Empty();
private bool IsReleaseThresholdReached(ProposalInfo proposal)
   var isRejected = IsProposalRejected(proposal);
   if (isRejected)
       return false;
   var isAbstained = IsProposalAbstained(proposal);
   return !isAbstained && CheckEnoughVoteAndApprovals(proposal);
private bool IsProposalRejected(ProposalInfo proposal)
   var rejectionMemberCount = proposal.Rejections.Count;
   return rejectionMemberCount > State.ProposalReleaseThreshold.Value.
→MaximalRejectionThreshold;
private bool IsProposalAbstained(ProposalInfo proposal)
   var abstentionMemberCount = proposal.Abstentions.Count;
```

```
return abstentionMemberCount > State.ProposalReleaseThreshold.Value.

MaximalAbstentionThreshold;
}
private bool CheckEnoughVoteAndApprovals(ProposalInfo proposal)
{
   var approvedMemberCount = proposal.Approvals.Count;
   var isApprovalEnough =
       approvedMemberCount >= State.ProposalReleaseThreshold.Value.

MinimalApprovalThreshold;
   if (!isApprovalEnough)
      return false;
   var isVoteThresholdReached =
       proposal.Abstentions.Concat(proposal.Approvals).Concat(proposal.Rejections).

Count() >=
      State.ProposalReleaseThreshold.Value.MinimalVoteThreshold;
   return isVoteThresholdReached;
}
```

21.4.3 Test

Before testing, two methods were added to a Dapp contract. We will test the proposal with these methods.

Define a singleton string and an organization address state in the State class:

```
public StringState Slogan { get; set; }
public SingletonState<Address> Organization { get; set; }
```

A pair of Set/Get methods:

In this way, during the test, create a proposal for the SetSlogan. After passing and releasing, use the GetSlogan method to check whether the Slogan has been modified.

Prepare a Stub that implements the ACS3 contract:

Since approval requires the contract to charge users, the user should send Approve transaction of the Token contract.

```
var tokenContractStub =
    GetTester<TokenContractContainer.TokenContractStub>(
        GetAddress(TokenSmartContractAddressNameProvider.StringName), keyPair);
await tokenContractStub.Approve.SendAsync(new ApproveInput
{
    Spender = DAppContractAddress,
    Symbol = "ELF",
    Amount = long.MaxValue
});
```

Create a proposal, the target method is SetSlogan, here we want to change the Slogan to "AEIf":

Make sure that the Slogan is still an empty string at this time and then vote:

```
// Check slogan
{
   var slogan = await acs3DemoContractStub.GetSlogan.CallAsync(new Empty());
   slogan.Value.ShouldBeEmpty();
}
await acs3DemoContractStub.Approve.SendAsync(proposalId);
```

Release proposal, and the Slogan becomes "AEIf".

```
await acs3DemoContractStub.Release.SendAsync(proposalId);
// Check slogan
{
   var slogan = await acs3DemoContractStub.GetSlogan.CallAsync(new Empty());
   slogan.Value.ShouldBe("AElf");
}
```

21.5 ACS4 - Consensus Standard

ACS4 is used to customize consensus mechanisms.

21.5.1 Interface

If you want to customize the consensus mechanism, you need to implement the following five interfaces:

Methods

Method	Request	Re-	Description
Name	Туре	sponse	
		Туре	
GetConsen-	google.prot	olouefs#ByTesn\&@	holdes the matter and onsensus command based on the consensus contract state
susCom-			and the input public key.
mand			
GetConsen-	google.proi	ાં જાળાં કર્યા છે. જે	http://dock.is.generated.
susExtra-

Generate-	google.prot	o louefs B. TheastVsci	duction Liste consensus system transactions when a block is generated. Each
Consensus-			block will contain only one consensus transaction, which is used to write
Transactions			the latest consensus information to the State database.
Validate-	google.proi	o louefs B. Mæki Ma	hills character the block, verify that the consensus information in the
Consensus-			block header is correct.
BeforeExe-			
cution			
Validate-	google.proi	o louefs 4B. Mæki Ma	hiderforsed ecuting the block, verify that the state information written to the
Consen-			consensus is correct.
susAfterEx-			
ecution			

Types

acs4.ConsensusCommand

Field	Туре	Description	La-
			bel
limit_milliseconds_of_mi	n ïng 3 2 block	Time limit of mining next block.	
hint	bytes	Context of Hint is diverse according to the consensus pro-	
		tocol we choose, so we use bytes.	
arranged_mining_time	google.protobuf.Tin	né Fhenti me of arrange mining.	
mining_due_time	google.protobuf.Tin	ne Fhore xpiration time of mining.	

acs4.TransactionList

Field	Туре	Description	Label
transactions	aelf.Transaction	Consensus system transactions.	repeated

acs4.ValidationResult

Field	Type	Description	Label
success	bool	Is successful.	
message	string	The error message.	
is_re_trigger	bool	Whether to trigger mining again.	

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Туре	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
		rThe height of the referenced block hash.	
ref_block_	pberfiess	The first four bytes of the referenced block hash.	
method_n	an ne ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Type	Description	Label
key	string		
value	bool		

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_id	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hslash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

21.5.2 Usage

The five interfaces defined in ACS4 basically correspond to the five methods of the ${\tt IConsensusService}$ in the ${\tt AElf.Kernel.Consensus}$ project:

ACS4	IConsensusService	Methodology	The Timing To Call
GetConsensusCommand	00	When TriggerConsen-	1. When the node is
	susAsync	susAsync is called,	started;
	(ChainContext chainContext);	it will use the account configured by	2. When the

		principle is the	
		same as GetConsensusEx- traData.	
	1	uaData.	

21.5.3 Example

You can refer to the implementation of the AEDPoS contract.

21.6 ACS5 - Contract Threshold Standard

If you want to raise the threshold for using contract, consider implementing ACS5.

21.6.1 Interface

To limit to call a method in a contract, you only need to implement the following five interfaces:

Methods

Method Name	Request Type	Response Type	Description
SetMethodCallingTh-	acs5.SetMethodCallingThresho	ld gopgl e.protobuf.Empty	Set the threshold for method
reshold			calling.
GetMethodCallingTh-	google.protobuf.StringValue	acs5.MethodCallingThre	shald the threshold for method
reshold			calling.

Types

acs5.MethodCallingThreshold

Field	Туре	Description	Label
sym-	MethodCallingThresh-	The threshold for method calling, token sym-	re-
bol_to_amount	old.SymbolToAmountEntry	bol -> amount.	peated
thresh-	ThresholdCheckType	The type of threshold check.	
old_check_type			

acs 5. Method Calling Threshold. Symbol To Amount Entry

Field	Type	Description	Label
key	string		
value	int64		

acs5.SetMethodCallingThresholdInput

Field	Type	Description	La-
			bel
method	string	The method name to check.

thresh-	ThresholdCheckType	The type of threshold check.	
old_check_type			

acs5.SetMethodCallingThresholdInput.SymbolToAmountEntry

Field	Туре	Description	Label
key	string		
value	int64		

acs5.ThresholdCheckType

Name	Number	Description	
BALANCE	0	Check balance only.	
ALLOWANCE	1	Check balance and allowance at the same time.	

21.6.2 Usage

Similar to ACS1, which uses an automatically generated pre-plugin transaction called ChargeTransactionFees to charge a transaction fee, ACS5 automatically generates a pre-plugin transaction called CheckThreshold to test whether the account that sent the transaction can invoke the corresponding method.

The implementation of CheckThreshold:

```
break;
}

else
{
    meetThreshold = true;
}

if (input.SymbolToThreshold.Count == 0)
{
    meetThreshold = true;
}
Assert(meetThreshold, "Cannot meet the calling threshold.");
    return new Empty();
}
```

In other words, if the token balance of the sender of the transaction or the amount authorized for the target contract does not reach the set limit, the pre-plugin transaction will throw an exception, thereby it prevents the original transaction from executing.

21.6.3 Implementation

Just lik the GetMethodFee of ACS1, you can implement only one GetMethodCallingThreshold method. It can also be achieved by using MappedState<string, MethodCallingThreshold> in the State class:

```
public MappedState<string, MethodCallingThreshold> MethodCallingThresholds { get; set;
```

But at the same time, do not forget to configure the call permission of SetMethodCallingThreshold, which requires the definition of an Admin in the State (of course, you can also use ACS3):

```
public SingletonState<Address> Admin { get; set; }
```

The easiest implementation

```
public override Empty SetMethodCallingThreshold(SetMethodCallingThresholdInput input)
{
    Assert(State.Admin.Value == Context.Sender, "No permission.");
    State.MethodCallingThresholds[input.Method] = new MethodCallingThreshold
    {
        SymbolToAmount = {input.SymbolToAmount}
    };
    return new Empty();
}

public override MethodCallingThreshold GetMethodCallingThreshold(StringValue input)
{
    return State.MethodCallingThresholds[input.Value];
}

public override Empty Foo(Empty input)
{
    return new Empty();
}
```

```
message SetMethodCallingThresholdInput {
    string method = 1;
    map<string, int64> symbol_to_amount = 2;// The order matters.
    ThresholdCheckType threshold_check_type = 3;
}
```

21.6.4 Test

You can test the Foo method defined above.

Make a Stub:

Before setting the threshold, check the current threshold, which should be 0:

The ELF balance of the caller of Foo should be greater than 1 ELF:

```
await acs5DemoContractStub.SetMethodCallingThreshold.SendAsync(
    new SetMethodCallingThresholdInput
{
        Method = nameof(acs5DemoContractStub.Foo),
        SymbolToAmount =
        {
            ("ELF", 1_0000_0000)
        },
            ThresholdCheckType = ThresholdCheckType.Balance
      });
```

Check the threshold again:

Send the Foo transaction via an account who has sufficient balance can succeed:

```
// Call with enough balance.
{
    var executionResult = await acs5DemoContractStub.Foo.SendAsync(new Empty());
```

```
executionResult.TransactionResult.Status.ShouldBe(TransactionResultStatus.Mined);
}
```

Send the Foo transaction via another account without ELF fails:

21.7 ACS6 - Random Number Provider Standard

If your contract is about to generate a random number, you can consider using acs6.

21.7.1 Interface

To provider a random number according to certain input, you only need to implement one interface:

Methods

Method	Request Type	Response Type	Description
Name			
GetRandom-	google.protobuf.BytesVal	u g oogle.protobuf.BytesVal	u€et the random number provided by this
Bytes			contract.

21.7.2 Usage

All you need is to override this method to return a random number according to the given input. You can decide the certain logic of generating random number yourself, just remember to return a BytesValue type, thus the caller can deserialize the output himself.

21.7.3 Implementation

The easiest implementation

```
public override BytesValue GetRandomBytes(BytesValue input)
{
    var serializedInput = new GetRandomBytesInput();
    serializedInput.MergeFrom(input.Value);
    var value = new Hash();
    value.MergeFrom(serializedInput.Value);
    var randomHashFromContext = Context.GetRandomHash(value);
```

21.8 ACS7 - Contract CrossChain Standard

ACS7 is for cross chain related contract implementation.

21.8.1 Interface

This involves methods for chain creation and indexing:

Methods

Method Name	Request Type	Response Type	Description
ProposeCrossChain- Indexing			Elimpsipose once cross chain indexing.
ReleaseCrossChain- IndexingProposal			Explyage the proposed indexing if already approved.
RequestSideChain- Creation			Eliptruest side chain creation.
ReleaseSideChain- Creation			Employase the side chain creation request if already approved and it will call the method CreateSideChain.
CreateSideChain			In C32 Med the side chain and returns the newly created side chain ID. Only SideChainLifetimeController is permitted to invoke this method.
Recharge			ERPCharge for the specified side chain.
DisposeSideChain			InDA3 Value a side chain according to side chain id. Only SideChainLifetimeController is permitted to invoke this method.
AdjustIndex- ingFeePrice	acs7.AdjustIndexin	g Fgæðigþuprotobuf.	EnAphinst side chain indexing fee. Only IndexingFeeController is permitted to invoke this method.
VerifyTransaction			Boled With unaross chain transaction.
Get- SideChainIdAnd- Height			difficient that the side chain id and height of the current chain.
GetSideChainIn- dexingInformation- List	google.protobuf.Em	p t ycs7.SideChainI	ndating the faing at item histion of side chains.
GetAllChainsI- dAndHeight			diffeight Dind recorded height of all chains.
GetIndexed- SideChainBlock- DataByHeight	google.protobuf.Int	6 4ฟัลโมษ ัทdexedSid	e ChecihoRiok davaaof indexed side chain according to height.
GetBoundPar- entChainHeigh- tAndMerklePathBy- Height			Meckine Mechine path/extend up with side chain according to height.
GetChainInitializa- tionData	google.protobuf.Int	3 2NasUC hainInitia	li cart á n Dalá zation data for specified side chain.

Types

acs7.AdjustIndexingFeeInput

Field	Type	Description	Label
side_chain_id	int32	The side chain id to adjust.	
indexing_fee	int64	The new price of indexing fee.	

acs 7. Chain Id And Height Dict

Field	Type	Description	La-
			bel
id_height_d	li C thainIdAndHeight-	A collection of chain ids and heights, where the key is the	re-
	Dict.IdHeightDictEntry	chain id and the value is the height.	peated

acs7.ChainIdAndHeightDict.IdHeightDictEntry

Field	Type	Description	Label
key	int32		
value	int64		

acs7.ChainInitializationConsensusInfo

Field	Type	Description	Label
initial_consensus_data	bytes	Initial consensus data.	

acs7.ChainInitializationData

Field	Туре	Description	La-
			bel
chain_id	int32	The id of side chain.	
creator	aelf.Address	The side chain creator.	
creation_timestamp	google.protobuf.Timest	antipe timestamp for side chain creation.	
cre-	int64	The height of side chain creation on parent chain.	
ation_height_on_parent_o	chain		
chain_creator_privilege_p	or <i>bserl</i> ved	Creator privilege boolean flag: True if chain creator	
		privilege preserved, otherwise false.	
par-	aelf.Address	Parent chain token contract address.	
ent_chain_token_contract	_address		
chain_initialization_cons	en Sks<u>ii</u>nIfo itialization-	Initial consensus information.	
	ConsensusInfo		
native_token_info_data	bytes	The native token info.	
resource_token_info	ResourceTokenInfo	The resource token information.	
chain_primary_token_inf	o ChainPrimaryToken-	The chain primary token information.	
	Info		

acs7.ChainPrimaryTokenInfo

Field	Туре	Description	Label
chain_primary_token_data	bytes	The side chain primary token data.	
side_chain_token_initial_issue_li	stSideChainTokenIni-	The side chain primary token initial issue	re-
	tialIssue	list.	peated

acs7.CreateSideChainInput

Field	Type	Description	La-
		•	bel
side_chain_creation_request	SideChainCreationRe-	The request information of the side chain cre-	
	quest	ation.	
proposer	aelf.Address	The proposer of the side chain creation.	

acs7.CrossChainBlockData

Field	Type	Description	Label
side_chain_block_data_list	SideChainBlockData	The side chain block data list to index.	repeated
parent_chain_block_data_list	ParentChainBlockData	The parent chain block data list to index.	repeated

acs7.CrossChainExtraData

Field	Туре	Description	La-
			bel
transac-	aelf.Hash	Merkle tree root of side chain block transaction status	
tion_status_merkle_tree_root		root.	

acs 7. Cross Chain Indexing Data Proposed Event

Field	Type	Description	Label
proposed_cross_chain_data	CrossChainBlockData	Proposed cross chain data to be indexed.	
proposal_id	aelf.Hash	The proposal id.	

acs7.CrossChainMerkleProofContext

Field	Type	Description	La-
			bel
bound_parent_chain_height	int64	The height of parent chain bound up with side chain.	
merkle_path_from_parent_chain	aelf.MerklePath	The merkle path generated from parent chain.	

acs7.IndexedParentChainBlockData

Field	Туре	Description	Label
local_chain_height	int64	The height of the local chain when indexing the par-	
		ent chain.	
par-	ParentChainBlock-	Parent chain block data.	re-
ent_chain_block_data_list	Data		peated

acs7.IndexedSideChainBlockData

Field	Туре	Description	Label
side_chain_block_data_list	SideChainBlockData	Side chain block data.	repeated

acs7.ParentChainBlockData

Field	Туре	Description	La- bel
height	int64	The height of parent chain.	
cross_chain_extra_data	CrossChainExtraData	The merkle tree root computing from side chain	
		roots.	
chain_id	int32	The parent chain id.	
transac-	aelf.Hash	The merkle tree root computing from transac-	
tion_status_merkle_tree	_root	tions status in parent chain block.	
indexed_merkle_path	ParentChainBlock-	Indexed block height from side chain and	re-
	Data.IndexedMerklePathEntry	merkle path for this side chain block	peated
extra_data	ParentChainBlock-	Extra data map.	re-
	Data.ExtraDataEntry		peated

acs7.ParentChainBlockData.ExtraDataEntry

Field	Туре	Description	Label
key	string		
value	bytes		

acs 7. Parent Chain Block Data. Indexed Merkle Path Entry

	Field	Type	Description	Label
ſ	key	int64		
	value	aelf.MerklePath		

acs7.RechargeInput

Field	Type	Description	Label
chain_id	int32	The chain id to recharge.	
amount	int64	The amount to recharge.	

acs 7. Release Cross Chain Indexing Proposal Input

Field	Type	Description	Label
chain_id_list	int32	List of chain ids to release.	repeated

acs7.ReleaseSideChainCreationInput

Field	Туре	Description	Label
proposal_id	aelf.Hash	The proposal id of side chain creation.	

acs7.ResourceTokenInfo

Field	Туре	Description	Label
re-	bytes	The resource token informa-	
source_token_list_data		tion.	
ini-	ResourceToken-	The initial resource token	re-
tial_resource_amount	${\it Info.} Initial Resource Amount Entry$	amount.	peated

acs 7. Resource Token Info. Initial Resource Amount Entry

Field	Type	Description	Label
key	string		
value	int32		

acs7.SideChainBlockData

Field	Type	Description	La-
			bel
height	int64	The height of side chain block.	
block_header_hash	aelf.Hash	The hash of side chain block.	
transac-	aelf.Hash	The merkle tree root computing from transactions status in side	
tion_status_merkle_tree_root		chain block.	
chain_id	int32	The id of side chain.	

acs7.SideChainBlockDataIndexed

acs 7. Side Chain Creation Request

Field	Type	Description	La-
			bel
indexing_price	int64	The cross chain indexing price.	
locked_token_amoun	t <i>int64</i>	Initial locked balance for a new side chain.	
is_privilege_preserve	dbool	Creator privilege boolean flag: True if chain cre-	
		ator privilege preserved, otherwise false.	
side_chain_token_cre	a Siole_GhqiveTo kenCreationRe-	Side chain token information.	
	quest		
side_chain_token_ini	ti Si<u>d</u>esCihe u <u>i</u> hiTokenInitialIssue	A list of accounts and amounts that will be issued	re-
		when the chain starts.	peated
ini-	SideChainCreationRe-	The initial rent resources.	re-
tial_resource_amoun	quest.InitialResourceAmountEnt	ry	peated

acs 7. Side Chain Creation Request. In it is alResource Amount Entry

Field	Type	Description	Label
key	string		
value	int32		

${\it acs7. Side Chain Index in g Information}$

Field	Type	Description	Label
chain_id	int32	The side chain id.	
indexed_height	int64	The indexed height.	

acs 7. Side Chain Indexing Information List

Field	Туре	Description	Label
index-	SideChainIndexingInfor-	A list contains indexing information of side	re-
ing_information_list	mation	chains.	peated

acs 7. Side Chain Token Creation Request

Field	Туре	Description	Label
side_chain_token_symbol	string	Token symbol of the side chain to be created	
side_chain_token_name	string	Token name of the side chain to be created	
side_chain_token_total_supply	int64	Token total supply of the side chain to be created	
side_chain_token_decimals	int32	Token decimals of the side chain to be created	

acs7.SideChainTokenInitialIssue

Field	Type	Description	Label
address	aelf.Address	The account that will be issued.	
amount	int64	The amount that will be issued.	

acs7.VerifyTransactionInput

Field	Туре	Description	Label
transaction_id	aelf.Hash	The cross chain transaction id to verify.	
path	aelf.MerklePath	The merkle path of the transaction.	
parent_chain_height	int64	The height of parent chain that indexing this transaction.	
verified_chain_id	int32	The chain if to verify.	

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Type	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf. Smart Contract Registration

Field	Type	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Туре	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Туре	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	_n im16 34	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_n	an at ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

aelf. Transaction Executing State Set. Reads Entry

Field	Туре	Description	Label
key	string		
value	bool		

aelf.TransactionExecutingStateSet.WritesEntry

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_id	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hslash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

21.8.2 Example

ACS7 declares methods for the scenes about cross chain. AEIf provides the implementation for ACS7, CrossChainContract. You can refer to the implementation of the *Cross chain contract api*.

21.9 ACS8 - Transaction Resource Token Fee Standard

ACS8 has some similarities to ACS1, both of them are charge transaction fee standard.

The difference is that ACS1 charges the user a transaction fee, ACS8 charges the called contract, and the transaction fee charged by ACS8 is the specified four tokens: WRITE, READ, NET, TRAFFIC.

In another word, if a contract declares that it inherits from ACS8, each transaction in this contract will charge four kinds of resource token.

21.9.1 Interface

Only one method is defined in the acs8.proto file:

Methods

Method	Request	Re-	Description
Name	Type	sponse	
		Туре	
BuyRe-	acs8.BuyRese	ou gooFbk.enb	to the four resource coins, which consumes the ELF balance in the
source-			contract account (you can recharge it yourself, or you can collect the user's
Token			ELF tokens as a profit to be self-sufficient).

Types

acs8.BuyResourceTokenInput

Field	Туре	Description	La- bel
symbol	string	The symbol token you want to buy.	
amount	int64	The amount you want to buy.	
pay_limit	int64	Limit of cost. If the token required for buy exceeds this value, the buy will be abandoned.	
		And 0 is no limit.	

21.9.2 Usage

The contract inherited from ACS1 uses a pre-plugin transaction called ChargeTransactionFees for charging transaction fee.

Because the specific charge amount is determined by the actual consumption of the transaction, the post-plugin generates ChargeResourceToken transaction to charge resource token.

The implementation of ChargeResourceToken is also similar to it of ChargeTransactionFees:

The amount of each resource token should be calculated by AElf.Kernel.FeeCalculation. In detail, A data structure named CalculateFeeCoefficients is defined in token_contract.proto, whose function is to save all coefficients of a polynomial, and every three coefficients are a group, such as a, b, c, which means (b / c) * $x ^a$. Each resource token has a polynomial that calculates it. Then according to the polynomial and the actual consumption of the resource, calculate the cost of the resource token. Finally, the cost is used as the parameter of ChargeResourceToken to generate this post-plugin transaction.

In addition, the method of the contract that has been owed cannot be executed before the contract top up resource token. As a result, a pre-plugin transaction is added, similar to the ACS5 pre-plugin transaction, which checks the contract's resource token balance, and the transaction's method name is CheckResourceToken:

21.10 ACS9 - Contract profit dividend standard

On the AEIf's side chain, the contract needs to declare where its profits are going, and implement ACS9.

21.10.1 Interface

ACS9 contains an method which does not have to be implemented:

Methods

Method	Request Type	Response	Description
Name		Type	
TakeCon-	acs9.TakeContract	Pı gəfuşla pputotobi	f. Esept for the developer to collect the profits from the contract
tractProfits			and the profits will be distributed in this method.
GetProfit-	google.protobuf.En	ıp a xs9.ProfitCor	fiQuery the config of profit.
Config			
GetProfit-	google.protobuf.En	ıp a çs9.ProfitsMo	pQuery the profits of the contract so far.
sAmount			

Types

acs9.ProfitConfig

Field	Type	Description	La-
			bel
dona-	int32	The portion of the profit that will be donated to the dividend pool each time	
tion_parts_per_hundi	ed	the developer receives the profit.	
prof-	string	The profit token symbol list.	re-
its_token_symbol_list			peated
stak-	string	The token symbol that the user can lock them to claim the profit.	
ing_token_symbol			

acs9.ProfitsMap

Field	Type	Description	Label
value	ProfitsMap.ValueEntry	The profits, token symbol -> amount.	repeated

acs9.ProfitsMap.ValueEntry

Field	Type	Description	Label
key	string		
value	int64		

acs9.TakeContractProfitsInput

Field	Туре	Description	Label
symbol	string	The token symbol to take.	
amount	int64	The amount to take.	

21.10.2 Implementation

Here we define a contract. The contract creates a token called APP at the time of initialization and uses the TokenHolder contract to create a token holder bonus scheme with the lock token is designated to APP.

The user will be given 10 APP when to sign up.

Users can purchase 1 APP with 1 ELF using method Deposit, and they can redeem the ELF using the method Withdraw.

When the user sends the Use transaction, the APP token is consumed.

Contract initialization is as follows:

```
public override Empty Initialize(InitializeInput input)
    State.TokenHolderContract.Value =
        Context.GetContractAddressByName(SmartContractConstants.
→TokenHolderContractSystemName);
    State.TokenContract.Value =
        {\tt Context.GetContractAddressByName}~({\tt SmartContractConstants.}
→TokenContractSystemName);
    State.DividendPoolContract.Value =
        Context.GetContractAddressByName(input.DividendPoolContractName.Value.
→ToBase64());
   State.Symbol.Value = input.Symbol == string.Empty ? "APP" : input.Symbol;
   State.ProfitReceiver.Value = input.ProfitReceiver;
   CreateToken(input.ProfitReceiver);
   // To test TokenHolder Contract.
   CreateTokenHolderProfitScheme();
    // To test ACS9 workflow.
   SetProfitConfig();
   State.ProfitReceiver.Value = input.ProfitReceiver;
   return new Empty();
private void CreateToken(Address profitReceiver, bool isLockWhiteListIncludingSelf =_
→false)
    var lockWhiteList = new List<Address>
        {Context.GetContractAddressByName(SmartContractConstants.
→TokenHolderContractSystemName) };
    if (isLockWhiteListIncludingSelf)
        lockWhiteList.Add(Context.Self);
    State.TokenContract.Create.Send(new CreateInput
        Symbol = State.Symbol.Value,
        TokenName = "DApp Token",
        Decimals = ACS9DemoContractConstants.Decimal,
        Issuer = Context.Self,
        IsBurnable = true,
        IsProfitable = true,
        TotalSupply = ACS9DemoContractConstants.TotalSupply,
        LockWhiteList =
            lockWhiteList
        }
    });
    State.TokenContract.Issue.Send(new IssueInput
        To = profitReceiver,
```

The State.symbol is a singleton of type string, state.Profitconfig is a singleton of type ProfitConfig, and state.profitreceiver is a singleton of type Address.

The user can use the SighUp method to register and get the bonus. Besides, it will create a archive for him:

```
/// <summary>
/// When user sign up, give him 10 APP tokens, then initialize his profile.
/// </summary>
/// <param name="input"></param>
/// <returns></returns>
public override Empty SignUp (Empty input)
   Assert(State.Profiles[Context.Sender] == null, "Already registered.");
   var profile = new Profile
        UserAddress = Context.Sender
    };
   State.TokenContract.Issue.Send(new IssueInput
       Symbol = State.Symbol.Value,
       Amount = ACS9DemoContractConstants.ForNewUser,
        To = Context.Sender
   });
   // Update profile.
   profile.Records.Add(new Record
        Type = RecordType.SignUp,
        Timestamp = Context.CurrentBlockTime,
        Description = string.Format("{0} +{1}",State.Symbol.Value,_
→ACS9DemoContractConstants.ForNewUser)
    State.Profiles[Context.Sender] = profile;
    return new Empty();
```

Recharge and redemption:

```
public override Empty Deposit(DepositInput input)
    // User Address -> DApp Contract.
   State.TokenContract.TransferFrom.Send(new TransferFromInput
        From = Context.Sender,
        To = Context.Self,
        Symbol = "ELF",
        Amount = input.Amount
    });
    State.TokenContract.Issue.Send(new IssueInput
        Symbol = State.Symbol.Value,
        Amount = input.Amount,
        To = Context.Sender
    });
    // Update profile.
    var profile = State.Profiles[Context.Sender];
   profile.Records.Add(new Record
        Type = RecordType.Deposit,
        Timestamp = Context.CurrentBlockTime,
        Description = string.Format("{0} +{1}", State.Symbol.Value, input.Amount)
    });
    State.Profiles[Context.Sender] = profile;
    return new Empty();
public override Empty Withdraw(WithdrawInput input)
    State.TokenContract.TransferFrom.Send(new TransferFromInput
        From = Context.Sender,
        To = Context.Self,
        Symbol = State.Symbol.Value,
        Amount = input.Amount
    });
    State.TokenContract.Transfer.Send(new TransferInput
        To = Context.Sender,
        Symbol = input.Symbol,
        Amount = input.Amount
    });
    State.TokenHolderContract.RemoveBeneficiary.Send(new_
→ RemoveTokenHolderBeneficiaryInput
        Beneficiary = Context.Sender,
        Amount = input.Amount
   });
    // Update profile.
   var profile = State.Profiles[Context.Sender];
   profile.Records.Add(new Record
        Type = RecordType.Withdraw,
        Timestamp = Context.CurrentBlockTime,
        Description = string.Format("{0} -{1}", State.Symbol.Value, input.Amount)
    });
    State.Profiles[Context.Sender] = profile;
```

```
return new Empty();
```

In the implementation of Use, 1/3 profits are directly transferred into the token holder dividend scheme:

```
public override Empty Use(Record input)
    State.TokenContract.TransferFrom.Send(new TransferFromInput
        From = Context.Sender,
        To = Context.Self,
        Symbol = State.Symbol.Value,
        Amount = ACS9DemoContractConstants.UseFee
    });
    if (input.Symbol == string.Empty)
        input.Symbol = State.TokenContract.GetPrimaryTokenSymbol.Call(new Empty()).
→Value;
    var contributeAmount = ACS9DemoContractConstants.UseFee.Div(3);
    State.TokenContract.Approve.Send(new ApproveInput
        Spender = State.TokenHolderContract.Value,
        Symbol = input.Symbol,
        Amount = contributeAmount
    });
    // Contribute 1/3 profits (ELF) to profit scheme.
    State.TokenHolderContract.ContributeProfits.Send(new ContributeProfitsInput
    {
        SchemeManager = Context.Self,
        Amount = contributeAmount,
        Symbol = input.Symbol
    });
    // Update profile.
    var profile = State.Profiles[Context.Sender];
   profile.Records.Add(new Record
        Type = RecordType.Withdraw,
        Timestamp = Context.CurrentBlockTime,
        Description = string.Format("{0} -{1}", State.Symbol.Value,...
→ACS9DemoContractConstants.UseFee),
        Symbol = input.Symbol
    });
   State.Profiles[Context.Sender] = profile;
    return new Empty();
```

The implementation of this contract has been completed. Next, implement ACS9 to perfect the profit distribution:

```
public override Empty TakeContractProfits(TakeContractProfitsInput input)
{
   var config = State.ProfitConfig.Value;
    // For Side Chain Dividends Pool.
   var amountForSideChainDividendsPool = input.Amount.Mul(config.
→DonationPartsPerHundred).Div(100);
    State.TokenContract.Approve.Send(new ApproveInput
        Symbol = input.Symbol,
        Amount = amountForSideChainDividendsPool,
```

```
Spender = State.DividendPoolContract.Value
    });
   State.DividendPoolContract.Donate.Send(new DonateInput
        Symbol = input.Symbol,
        Amount = amountForSideChainDividendsPool
    });
    // For receiver.
   var amountForReceiver = input.Amount.Sub(amountForSideChainDividendsPool);
   State.TokenContract.Transfer.Send(new TransferInput
        To = State.ProfitReceiver.Value,
       Amount = amountForReceiver,
       Symbol = input.Symbol
    // For Token Holder Profit Scheme. (To distribute.)
   State.TokenHolderContract.DistributeProfits.Send(new DistributeProfitsInput
        SchemeManager = Context.Self
    });
   return new Empty();
public override ProfitConfig GetProfitConfig(Empty input)
    return State.ProfitConfig.Value;
public override ProfitsMap GetProfitsAmount(Empty input)
   var profitsMap = new ProfitsMap();
    foreach (var symbol in State.ProfitConfig.Value.ProfitsTokenSymbolList)
        var balance = State.TokenContract.GetBalance.Call(new GetBalanceInput
           Owner = Context.Self,
            Symbol = symbol
        }).Balance;
        profitsMap.Value[symbol] = balance;
   return profitsMap;
```

21.10.3 Test

Since part of the profits from the ACS9 contract transfer to the Token contract and the other transfer to the dividend pool, a TokenHolder Stub and a contract implementing ACS10 Stub are required in the test. Accordingly, the contracts that implements ACS9 or ACS10 need to be deployed. Before the test begins, the contract implementing ACS9 can be initialized by interface IContractInitializationProvider, and sets the dividend pool's name to the other contract's name:

```
new InitializeMethod
{

    MethodName = nameof(ACS9DemoContract.Initialize),
    Params = new InitializeInput
    {

         ProfitReceiver = Address.FromPublicKey(SampleECKeyPairs.KeyPairs.

Skip(3).First().PublicKey),

         DividendPoolContractName = ACS10DemoSmartContractNameProvider.Name
        }.ToByteString()

    }
};

public Hash SystemSmartContractName { get; } = ACS9DemoSmartContractNameProvider.

Name;

public string ContractCodeName { get; } = "AElf.Contracts.ACS9DemoContract";
}
```

Prepare a user account:

Prepare some Stubs:

Then, transfer ELF to the user (TokenContractStub is the Stub of the initial bp who has much ELF):

```
// Transfer some ELFs to user.
await TokenContractStub.Transfer.SendAsync(new TransferInput
{
    To = address,
        Symbol = "ELF",
        Amount = 1000_00000000
});
```

Have the user call SignUp to check if he/she has got 10 APP tokens:

```
await acs9DemoContractStub.SignUp.SendAsync(new Empty());
// User has 10 APP tokens because of signing up.
(await GetFirstUserBalance("APP")).ShouldBe(10_00000000);
```

Test the recharge method of the contract itself:

```
var elfBalanceBefore = await GetFirstUserBalance("ELF");
// User has to Approve an amount of ELF tokens before deposit to the DApp.
```

```
await userTokenStub.Approve.SendAsync(new ApproveInput
{
    Amount = 1000_000000000,
    Spender = ACS9DemoContractAddress,
    Symbol = "ELF"
});
await acs9DemoContractStub.Deposit.SendAsync(new DepositInput
{
    Amount = 100_00000000
});
// Check the change of balance of ELF.
var elfBalanceAfter = await GetFirstUserBalance("ELF");
elfBalanceAfter.ShouldBe(elfBalanceBefore - 100_00000000);
// Now user has 110 APP tokens.
(await GetFirstUserBalance("APP")).ShouldBe(110_00000000);
```

The user locks up 57 APP via the TokenHolder contract in order to obtain profits from the contract:

```
// User lock some APP tokens for getting profits. (APP -57)
await userTokenHolderStub.RegisterForProfits.SendAsync(new RegisterForProfitsInput
{
    SchemeManager = ACS9DemoContractAddress,
    Amount = 57_00000000
});
```

The Use method is invoked 10 times and 0.3 APP is consumed each time, and finally the user have 50 APP left:

```
await userTokenStub.Approve.SendAsync(new ApproveInput
{
    Amount = long.MaxValue,
    Spender = ACS9DemoContractAddress,
    Symbol = "APP"
});
// User uses 10 times of this DApp. (APP -3)
for (var i = 0; i < 10; i++)
{
    await acs9DemoContractStub.Use.SendAsync(new Record());
}
// Now user has 50 APP tokens.
(await GetFirstUserBalance("APP")).ShouldBe(50_00000000);</pre>
```

Using the TakeContractProfits method, the developer attempts to withdraw 10 ELF as profits. The 10 ELF will be transferred to the developer in this method:

```
const long baseBalance = 0;
{
    var balance = await TokenContractStub.GetBalance.CallAsync(new GetBalanceInput
    {
        Owner = UserAddresses[1], Symbol = "ELF"
    });
    balance.Balance.ShouldBe(baseBalance);
}
// Profits receiver claim 10 ELF profits.
await acs9DemoContractStub.TakeContractProfits.SendAsync(new TakeContractProfitsInput
{
    Symbol = "ELF",
```

```
Amount = 10_0000_0000

});

// Then profits receiver should have 9.9 ELF tokens.

{
   var balance = await TokenContractStub.GetBalance.CallAsync(new GetBalanceInput
   {
        Owner = UserAddresses[1], Symbol = "ELF"
     });
     balance.Balance.ShouldBe(baseBalance + 9_9000_0000);
}
```

Next check the profit distribution results. The dividend pool should be allocated 0.1 ELF:

The user receives 1 ELF from the token holder dividend scheme:

```
// Help user to claim profits from token holder profit scheme.
await TokenHolderContractStub.ClaimProfits.SendAsync(new ClaimProfitsInput
{
    Beneficiary = UserAddresses[0],
    SchemeManager = ACS9DemoContractAddress,
});
// Profits should be 1 ELF.
(await GetFirstUserBalance("ELF")).ShouldBe(elfBalanceAfter + 1_0000_0000);
```

Finally, let's test the Withdraw method.

```
// Withdraw
var beforeBalance =
    await userTokenStub.GetBalance.CallAsync(new GetBalanceInput
    {
        Symbol = "APP",
        Owner = UserAddresses[0]
     });
var withDrawResult = await userTokenHolderStub.Withdraw.
        SendAsync(ACS9DemoContractAddress);
withDrawResult.TransactionResult.Status.ShouldBe(TransactionResultStatus.Mined);
var resultBalance = await userTokenStub.GetBalance.CallAsync(new GetBalanceInput
     {
        Symbol = "APP",
```

```
Owner = UserAddresses[0]
});
resultBalance.Balance.ShouldBe(beforeBalance.Balance + 57_00000000);
```

21.11 ACS10 - Dividend Pool Standard

ACS10 is used to construct a dividend pool in the contract.

21.11.1 Interface

To construct a dividend pool, you can implement the following interfaces optionally:

Methods

Method	Request	Re-	Description
Name	Туре	sponse	
		Type	
Donate	acs10.Donate	In gao gle.prote	bb Chates y tokens from the caller to the treasury. If the tokens are not
			native tokens in the current chain, they will be first converted to the
			native token.
Release	acs10.Release	In gou gle.prote	bReTemperydividend pool according the period number.
SetSymbol-	acs10.Symbol	Li g toogle.prote	bSetBimptoken symbols dividend pool supports.
List			
GetSymbol-	google.protob	ufd ænþû sSymb	olQisery the token symbols dividend pool supports.
List			
GetUndis-	google.protob	ufa lcenlpar ,Divid	enQuery the balance of undistributed tokens whose symbols are in-
tributedDiv-			cluded in the symbol list.
idends			
GetDivi-	google.protob	ufd ers 60.Val vie l	en@wery the dividend information according to the height.
dends			

Types

acs10.Dividends

Field	Туре	Description	Label
value	Dividends.ValueEntry	The dividends, symbol -> amount.	repeated

acs10.Dividends.ValueEntry

Field	Type	Description	Label
key	string		
value	int64		

acs10.DonateInput

Field	Туре	Description	Label
symbol	string	The token symbol to donate.	
amount	int64	The amount to donate.	

acs10.DonationReceived

Field	Туре	Description	Label
from	aelf.Address	The address of donors.	
pool_contract	aelf.Address	The address of dividend pool.	
symbol	string	The token symbol Donated.	
amount	int64	The amount Donated.	

acs10.ReleaseInput

Field	Type	Description	Label
period_number	int64	The period number to release.	

acs10.SymbolList

Field	Type	Description	Label
value	string	The token symbol list.	repeated

aelf.Address

Field	Type	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Туре	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Type	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Type	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Type	Description	La-
			bel
from	from Ad - The address of the sender of the transaction.		
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	nimmotek	rThe height of the referenced block hash.	
ref_block_	plognes	The first four bytes of the referenced block hash.	
method_n	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

aelf.TransactionExecutingStateSet.DeletesEntry

Field	Type	Description	Label
key	string		
value	bool		

$aelf. Transaction {\tt Executing State Set. Reads Entry}$

Field	Туре	Description	Label
key	string		
value	bool		

$aelf. Transaction {\bf Executing State Set. Writes Entry}$

Field	Type	Description	Label
key	string		
value	bytes		

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imto er	The height of the block hat packages the transaction.	
block_	h <i>l</i> Hdash	The hash of the block hat packages the transaction.	
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num-	Description
	ber	
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAIL	EIØ	Transaction validation failed.

21.11.2 Usage

ACS10 only unifies the standard interface of the dividend pool, which does not interact with the AEIf chain.

21.11.3 Implementation

With the Profit contract

A Profit Scheme can be created using the CreateScheme method of Profit contract:

The Context.GenerateId method is a common method used by the AEIf to generate Id. We use the address of the Profit contract and the schemeToken provided to the Profit contract to calculate the Id of the scheme, and we set this id to State.ProfitSchemeId (SingletonState<Hash>).

After the establishment of the dividend scheme:

- ContributeProfits method of Profit can be used to implement the method Donate in ACS10.
- The Release in the ACS10 can be implemented using the method DistributeProfits in the Profit contract;
- Methods such as AddBeneficiary and RemoveBeneficiary can be used to manage the recipients and their weight.
- AddSubScheme, RemoveSubScheme and other methods can be used to manage the sub-dividend scheme and its weight;
- The SetSymbolList and GetSymbolList can be implemented by yourself. Just make sure the symbol list you set is used correctly in Donate and Release.
- GetUndistributedDividends returns the balance of the token whose symbol is included in symbol list.

With TokenHolder Contract

When initializing the contract, you should create a token holder dividend scheme using the CreateScheme in the TokenHolder contract(Token Holder Profit Scheme

```
});
return new Empty();
```

In a token holder dividend scheme, a scheme is bound to its creator, so SchemeId is not necessary to compute (in fact, the scheme is created via the Profit contract).

Considering the GetDividends returns the dividend information according to the input height, so each Donate need update dividend information for each height. A Donate can be implemented as:

```
public override Empty Donate(DonateInput input)
    State.TokenContract.TransferFrom.Send(new TransferFromInput
        From = Context.Sender,
        Symbol = input.Symbol,
        Amount = input.Amount,
        To = Context.Self
    State.TokenContract.Approve.Send(new ApproveInput
        Symbol = input.Symbol,
        Amount = input.Amount,
        Spender = State.TokenHolderContract.Value
    State.TokenHolderContract.ContributeProfits.Send(new ContributeProfitsInput
        SchemeManager = Context.Self,
        Symbol = input.Symbol,
        Amount = input.Amount
    });
    Context.Fire(new DonationReceived
        From = Context.Sender,
        Symbol = input.Symbol,
        Amount = input.Amount,
        PoolContract = Context.Self
    });
    var currentReceivedDividends = State.ReceivedDividends[Context.CurrentHeight];
    if (currentReceivedDividends != null && currentReceivedDividends.Value.
→ContainsKey(input.Symbol))
    {
        currentReceivedDividends.Value[input.Symbol] =
            currentReceivedDividends.Value[input.Symbol].Add(input.Amount);
    }
    else
        currentReceivedDividends = new Dividends
            Value =
                {
                    input.Symbol, input.Amount
        };
    State.ReceivedDividends[Context.CurrentHeight] = currentReceivedDividends;
```

The method Release directly sends the TokenHolder's method DistributeProfits transaction:

```
public override Empty Release(ReleaseInput input)
{
    State.TokenHolderContract.DistributeProfits.Send(new DistributeProfitsInput
    {
        SchemeManager = Context.Self
    });
    return new Empty();
}
```

In the TokenHolder contract, the default implementation is to release what token is received, so SetSymbolList does not need to be implemented, and GetSymbolList returns the symbol list recorded in dividend scheme:

```
public override Empty SetSymbolList(SymbolList input)
    Assert(false, "Not support setting symbol list.");
    return new Empty();
public override SymbolList GetSymbolList(Empty input)
   return new SymbolList
        Value =
            GetDividendPoolScheme().ReceivedTokenSymbols
    } ;
private Scheme GetDividendPoolScheme()
    if (State.DividendPoolSchemeId.Value == null)
        var tokenHolderScheme = State.TokenHolderContract.GetScheme.Call(Context.
\hookrightarrowSelf);
        State.DividendPoolSchemeId.Value = tokenHolderScheme.SchemeId;
    }
   return Context.Call<Scheme>(
        {\tt Context.GetContractAddressByName}~({\tt SmartContractConstants.}
→ProfitContractSystemName),
        nameof(ProfitContractContainer.ProfitContractReferenceState.GetScheme),
        State.DividendPoolSchemeId.Value);
```

The implementation of GetUndistributedDividends is the same as described in the previous section, and it returns the balance:

```
public override Dividends GetUndistributedDividends(Empty input)
{
   var scheme = GetDividendPoolScheme();
```

In addition to the Profit and TokenHolder contracts, of course, you can also implement a dividend pool on your own contract.

21.11.4 Test

The dividend pool, for example, is tested in two ways with the TokenHolder contract.

One way is for the dividend pool to send Donate, Release and a series of query operations;

The other way is to use an account to lock up, and then take out dividends.

Define the required Stubs:

Before proceeding, You should Approve the TokenHolder contract and the dividend pool contract.

```
await tokenContractStub.Approve.SendAsync(new ApproveInput
{
    Spender = TokenHolderContractAddress,
    Symbol = "ELF",
    Amount = long.MaxValue
});
await tokenContractStub.Approve.SendAsync(new ApproveInput
{
    Spender = DAppContractAddress,
    Symbol = "ELF",
    Amount = long.MaxValue
});
```

Lock the position, at which point the account balance is reduced by 10 ELF:

```
await tokenHolderContractStub.RegisterForProfits.SendAsync(new RegisterForProfitsInput
{
    SchemeManager = DAppContractAddress,
    Amount = amount
});
```

Donate, at which point the account balance is reduced by another 10 ELF:

```
await acs10DemoContractStub.Donate.SendAsync(new DonateInput
{
    Symbol = "ELF",
    Amount = amount
});
```

At this point you can test the GetUndistributedDividends and GetDividends:

Release bonus, and test GetUndistributedDividends again:

```
await acs10DemoContractStub.Release.SendAsync(new ReleaseInput
{
    PeriodNumber = 1
});
// Check undistributed dividends after releasing.
{
    var undistributedDividends =
        await acs10DemoContractStub.GetUndistributedDividends.CallAsync(new Empty());
    undistributedDividends.Value["ELF"].ShouldBe(0);
}
```

Finally, let this account receive the dividend and then observe the change in its balance:

```
var balanceBeforeClaimForProfits = await tokenContractStub.GetBalance.CallAsync(new_
GetBalanceInput
{
    Owner = address,
    Symbol = "ELF"
});
await tokenHolderContractStub.ClaimProfits.SendAsync(new ClaimProfitsInput
{
    SchemeManager = DAppContractAddress,
    Beneficiary = address
});
var balanceAfterClaimForProfits = await tokenContractStub.GetBalance.CallAsync(new_
GetBalanceInput
```

21.11.5 Example

The dividend pool of the main chain and the side chain is built by implementing ACS10.

The dividend pool provided by the Treasury contract implementing ACS10 is on the main chain.

The dividend pool provided by the Consensus contract implementing ACS10 is on the side chain.

21.12 ACS11 - Cross Chain Consensus Standard

ACS11 is used to customize consensus mechanisms for cross chain.

21.12.1 Interface

The contract inherited from ACS11 need implement the following interfaces:

Methods

Method Name	Request Type	Response Type	Description
UpdateInformationFrom-	google.protobuf.Byte	s Yohg le.protobuf.Emp	typdate the consensus information of the
CrossChain			side chain.
GetChainInitializationIn-	google.protobuf.Byte	s Yohg le.protobuf.Byte	es Vadue the current miner list and consensus
formation			round information.
CheckCrossChainIndex-	aelf.Address	google.protobuf.Boo	When if y that the input address is the current
ingPermission			miner.

Types

aelf.Address

Field	Туре	Description	Label
value	bytes		

aelf.BinaryMerkleTree

Field	Type	Description	Label
nodes	Hash	The leaf nodes.	repeated
root	Hash	The root node hash.	
leaf_count	int32	The count of leaf node.	

aelf.Hash

Field	Type	Description	Label
value	bytes		

aelf.LogEvent

Field	Type	Description	Label
address	Address	The contract address.	
name	string	The name of the log event.	
indexed	bytes	The indexed data, used to calculate bloom.	repeated
non_indexed	bytes	The non indexed data.	

aelf.MerklePath

Field	Туре	Description	Label
merkle_path_nodes	MerklePathNode	The merkle path nodes.	repeated

aelf.MerklePathNode

Field	Туре	Description	Label
hash	Hash	The node hash.	
is_left_child_node	bool	Whether it is a left child node.	

aelf.SInt32Value

Field	Type	Description	Label
value	sint32		

aelf.SInt64Value

Field	Type	Description	Label
value	sint64		

aelf.ScopedStatePath

Field	Туре	Description	Label
address	Address	The scope address, which will be the contract address.	
path	StatePath	The path of contract state.	

aelf.SmartContractRegistration

Field	Туре	Description	Label
category	sint32	The category of contract code(0: C#).	
code	bytes	The byte array of the contract code.	
code_hash	Hash	The hash of the contract code.	
is_system_contract	bool	Whether it is a system contract.	
version	int32	The version of the current contract.	

aelf.StatePath

Field	Туре	Description	Label
parts	string	The partial path of the state path.	repeated

aelf.Transaction

Field	Туре	Description	La-
			bel
from	Ad-	The address of the sender of the transaction.	
	dress		
to	Ad-	The address of the contract when calling a contract.	
	dress		
ref_block_	n imm otek	rThe height of the referenced block hash.	
ref_block_	plogness	The first four bytes of the referenced block hash.	
method_na	an ae ring	The name of a method in the smart contract at the To address.	
params	bytes	The parameters to pass to the smart contract method.	
signa-	bytes	When signing a transaction it's actually a subset of the fields: from/to and the target	
ture		method as well as the parameter that were given. It also contains the reference block	
		number and prefix.	

$aelf. Transaction {\bf Executing State Set}$

Field	Туре	Description	Label
writes	TransactionExecutingStateSet.WritesEntry	The changed states.	repeated
reads	TransactionExecutingStateSet.ReadsEntry	The read states.	repeated
deletes	TransactionExecutingStateSet.DeletesEntry	The deleted states.	repeated

$aelf. Transaction {\tt Executing State Set. Deletes Entry}$

aelf.TransactionResult

Field	Type	Description	La-
			bel
trans-	Hash	The transaction id.	
ac-			
tion_ic	1		
sta-	Trans-	The transaction result status.	
tus	action-		
	Result-		
	Status		
logs	Lo-	The log events.	re-
	gEvent		peated
bloom	bytes	Bloom filter for transaction logs. A transaction log event can be defined in the contract	
		and stored in the bloom filter after the transaction is executed. Through this filter, we	
		can quickly search for and determine whether a log exists in the transaction result.	
re-	bytes	The return value of the transaction execution.	
turn_v	alue		
block_	n imo er	The height of the block hat packages the transaction.	
block_	block hat block hat packages the transaction.		
error	string	Failed execution error message.	

aelf.TransactionResultStatus

Name	Num- ber	Description
NOT EXHCTED		
NOT_EXISTED	0	The execution result of the transaction does not exist.
PENDING	1	The transaction is in the transaction pool waiting to be packaged.
FAILED	2	Transaction execution failed.
MINED	3	The transaction was successfully executed and successfully packaged
		into a block.
CONFLICT	4	When executed in parallel, there are conflicts with other transactions.
PENDING_VALIDATION	5	The transaction is waiting for validation.
NODE_VALIDATION_FAILEI		Transaction validation failed.

21.12.2 Example

ACS11 declares methods for the scenes about customize consensus mechanisms for cross chain. AEIf provides the implementation for ACS11, AEDPoS Contract api.

Command line interface

22.1 Introduction to the CLI

The **aelf-command** tool is a CLI tool built for interacting with an AElf node. This section will walk you through some of the most commonly used features and show you how to install the tool.

22.1.1 Features

- Get or Set common configs, endpoint, account, datadir, password.
- For new users who are not familiar with the CLI parameters, any missing parameters will be asked in a prompting way.
- Create a new account.
- Load an account from a given private key or mnemonic.
- Show wallet details which include private key, address, public key and mnemonic.
- Encrypt account info into keyStore format and save to file.
- Get current Best Height of the chain.
- Get block info by a given height or block hash.
- Get transaction result by a given transaction id.
- Send a transaction or call a read-only method on a smart contract.
- Deploy a smart contract.
- Open a REPL for using JavaScript to interact with the chain.
- Friendly interactions, beautify with chalk & ora.
- Get current chain status.
- Create a proposal on any contract method.

- Deserialize the result returned by executing a transaction.
- Start a socket.io server for supplying services for dApps.

22.1.2 Install aelf-command

```
npm i aelf-command -g
```

22.1.3 Using aelf-command

First Step

You need to create a new account or load a account by a private key or mnemonic you already have.

· Create a new wallet

Load wallet from private key

• show wallet info you already have

Here you can get the account info and decide whether to encrypt account info and save into a file.

Examples:

```
$ aelf-command console -a 2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR5oGin1sys6H
✓ Enter the the URI of an AElf node: http://127.0.0.1:8000
✓ Enter the password you typed when creating a wallet \dots *******
✓ Succeed!
Welcome to aelf interactive console. Ctrl + C to terminate the program. Double tap_
→ Tab to list objects
     NAME
                 | DESCRIPTION
      AElf
                 | imported from aelf-sdk
      aelf
                 | the instance of an aelf-sdk, connect to
                 | http://127.0.0.1:8000
                | the instance of an AElf wallet, address
      _account
                 | is

                                                              Deprecated! Please use _
→`aelf-command send` , check details in aelf-command `README.md`
 config <flag> [key] [value]
                                                              Get, set, delete or_
→list aelf-command config
 event [tx-id]
                                                              Deserialize the result,
→returned by executing a transaction
 dapp-server [options]
                                                              Start a dAPP SOCKET.IO
-server
```

in your terminal and get useful information.

Any sub-commands such as call, you can get help by typing this

```
$ aelf-command call -h
Usage: aelf-command call [options] [contract-address|contract-name] [method] [params]

Call a read-only method on a contract.

Options:
    -h, --help output usage information

Examples:

aelf-command call <contractName|contractAddress> <method> <params> aelf-command call <contractName|contractAddress> <method> aelf-command call <contractName|contractAddress> aelf-command call <contractName|contractAddress> aelf-command call

$ aelf-command console -h
Usage: aelf-command console [options]
```

```
Open a node REPL

Options:
-h, --help output usage information

Examples:
aelf-command console
...
```

22.2 Commands

22.2.1 Common options

- datadir: The directory that contains aelf-command files, such as encrypted account info keyStore files. Default to be {home}/.local/share/aelf
- endpoint: The endpoint for the RPC service.
- account: The account to be used to interact with the blockchain endpoint.
- password: The password for unlocking the given account.

You can specified options above in several ways, and the priority is in the order of low to high.

1. export variables in shell.

```
# This is datadir
$ export AELF_CLI_DATADIR=/Users/{you}/.local/share/aelf
# This is endpoint
$ export AELF_CLI_ENDPOINT=http://127.0.0.1:8000
# This is account
$ export AELF_CLI_ACCOUNT=2Ue31YTuB5Szy7c...gtGi5uMQBYarYUR5oGin1sys6H
```

2. aelf-command global .aelfrc config file

The global config file is stored in the <datadir>/.aelfrc file, you can read the config file, but better not modify it by yourself.

Modify this config file by aelf-command config.

• set: set and save config in the file, remember just set the datadir, endpoint, account, password four keys.

```
$ aelf-command config set endpoint http://127.0.0.1:8000

✓ Succeed!

$ aelf-command config -h
Usage: aelf-command config [options] <flag> [key] [value]

get, set, delete or list aelf-command config

Options:
   -h, --help output usage information

Examples:
```

(continues on next page)

22.2. Commands 531

```
aelf-command config get <key>
aelf-command config set <key> <value>
aelf-command config delete <key>
aelf-command config list
```

• get: get the value of given key from global .aelfrc file

```
$ aelf-command config get endpoint
http://127.0.0.1:8000
```

• delete: delete the <key, value> from global .aelfrc file by a given key

```
$ aelf-command config delete endpoint

    Succeed!
```

• list: get the list of all configs stored in global .aelfrc file

```
$ aelf-command config list
endpoint=http://127.0.0.1:8000
password=password
```

Remember config command only can be used to modify the global .aelfrc file for now, more usages such as modify working directory will be implemented in later.

3. aelf-command working directory .aelfrc file

The current working directory of aelf-command can have a file named .aelfrc and store configs, the format of this file is like global .aelfrc file:

```
endpoint http://127.0.0.1:8000 password yourpassword
```

each line is <key, value> config and a whitespace is needed to separate them.

4. aelf-command options.

You can give common options by passing them in CLI parameters.

```
aelf-command console -a sadaf -p password -e http://127.0.0.1:8000
```

Notice the priority, the options given in higher priority will overwrite the lower priority.

22.2.2 create - Create a new account

This command will create a new account.

```
$ aelf-command create -h
Usage: aelf-command create [options] [save-to-file]

create a new account

Options:
   -c, --cipher [cipher] Which cipher algorithm to use, default to be aes-128-ctr
   -h, --help output usage information
```

```
Examples:
    aelf-command create <save-to-file>
    aelf-command create
```

Example:

• Specify the cipher way to encrypt account info by passing option -c [cipher], such as:

```
aelf-command create -c aes-128-cbc
```

22.2.3 load - Load an account by a given private key or mnemonic

This command allow you load an account from backup.

```
# load from mnemonic
$ aelf-command load 'great mushroom loan crisp ... door juice embrace'
# load from private key
$ aelf-command load 'e038eea7e151eb451ba2901f7...b08ba5b76d8f288'
# load from prompting
$ aelf-command load
? Enter a private key or mnemonic > e038eea7e151eb451ba2901f7...b08ba5b76d8f288
...
```

22.2.4 wallet - Show wallet details which include private key, address, public key and mnemonic

This command allows you to print wallet info.

```
$ aelf-command wallet -a C91b1SF5mMbenHZTfdfbJSkJcK7HMjeiuw...8qYjGsESanXR

AElf [Info]: Private Key : 97ca9fbece296231f26bee0e493500810f...

$\topocodogb4698469a8dc22ec9ec89ebb00$

AElf [Info]: Public Key : 04c30dd0c3b5abfc85a11b15dabd0de926...

$\topoptogap 74fe04e92eaebf2e4fef6445d9b9b11efe6f4b70c8e86644b72621f9987dc00bb1eab44a9bd7512ea53f93937a5d0

AElf [Info]: Address : C91b1SF5mMbenHZTfdfbJSkJcK7HMjeiuw...8qYjGsESanXR
```

22.2.5 proposal - Create a proposal

There are three kinds of proposal contracts in AEIf:

- AElf.ContractNames.Parliament
- AElf.ContractNames.Referendum
- AElf.ContractNames.Association

depending on your needs you can choose one and create a proposal.

· Get an organization address or create one

Get the default organization's address with the parliament contract (AElf.ContractNames.Parliament):

22.2. Commands 533

```
$ aelf-command call AElf.ContractNames.Parliament GetDefaultOrganizationAddress

✓ Fetching contract successfully!

✓ Calling method successfully!
AElf [Info]:
Result:
"BkcXRkykRC2etHp9hgFfbw2ec1edx7ERBxYtbC97z3Q2bNCwc"

✓ Succeed!
```

BkcXRkykRC2etHp9hqFfbw2ec1edx7ERBxYtbC97z3Q2bNCwc is the default organization address.

The default organization is an organization that contains all miners; every proposal under AElf.ContractNames. Parliament can only be released when it has got over 2/3 miners approval.

Create an organization with the Referendum contract (AElf.ContractNames.Referendum):

```
$ aelf-command send AElf.ContractNames.Referendum

✓ Fetching contract successfully!

? Pick up a contract method: CreateOrganization
If you need to pass file contents as a parameter, you can enter the relative or_
→absolute path of the file
Enter the params one by one, type `Enter` to skip optional parameters:
? Enter the required param <tokenSymbol>: ELF
? Enter the required param  proposalReleaseThreshold.minimalApprovalThreshold>: 666
? Enter the required param  proposalReleaseThreshold.maximalAbstentionThreshold>: 666
? Enter the required param  proposalReleaseThreshold.minimalVoteThreshold>: 666
? Enter the required param proposerWhiteList.proposers>: [
→"2hxkDq6Pd2d4yU1A16PTZVMMrEDYEPR8oQojMDwWdax5LsBaxX"]
The params you entered is:
 "tokenSymbol": "ELF",
 "proposalReleaseThreshold": {
   "minimalApprovalThreshold": 666,
   "maximalRejectionThreshold": 666,
   "maximalAbstentionThreshold": 666,
   "minimalVoteThreshold": 666
  "proposerWhiteList": {
   "proposers": [
     "2hxkDg6Pd2d4yU1A16PTZVMMrEDYEPR8oQojMDwWdax5LsBaxX"
  }
✓ Succeed!
AElf [Info]:
Result:
 "TransactionId": "273285c7e8825a0af5291dd5d9295f746f2bb079b30f915422564de7a64fc874"

✓ Succeed!
```

Create a proposal

```
$ aelf-command proposal
? Pick up a contract name to create a proposal: AElf.ContractNames.Parliament
? Enter an organization address: BkcXRkykRC2etHp9hgFfbw2ec1edx7ERBxYtbC97z3Q2bNCwc
```

```
? Select the expired time for this proposal: 2022/09/23 22:06
? Optional, input an URL for proposal description:
? Enter a contract address or name: AElf.ContractNames.Token
\checkmark Fetching contract successfully!
? Pick up a contract method: Transfer
If you need to pass file contents to the contractMethod, you can enter the relative,
→or absolute path of the file instead
Enter required params one by one:
? Enter the required param <to>: 2hxkDg6Pd2d4yU1A16PTZVMMrEDYEPR8oQojMDwWdax5LsBaxX
? Enter the required param <symbol>: ELF
? Enter the required param <amount>: 100000000
? Enter the required param <memo>: test
AElf [Info]:
 { TransactionId:
   '09c8c824d2e3aea1d6cd15b7bb6cefe4e236c5b818d6a01d4f7ca0b60fe99535' }

√ loading proposal id...
AElf [Info]: Proposal id:
→"bafe83ca4ec5b2a2f1e8016d09b21362c9345954a014379375f1a90b7afb43fb".

√ Succeed!
```

You can get the proposal id, then get the proposal's status.

· Get proposal status

toBeReleased indicates whether you can release this proposal. By default, a proposal needs over 2/3 BP nodes approval.

· Release a proposal

You can release a proposal when it got approved.

Get the transaction result

22.2. Commands 535

```
"TransactionId": "09c8c824d2e3aeald...cefe4e236c5b818d6a01d4f7ca0b60fe99535",

→iuwv1TdQqIV4318HrqFLsGpx9m3+sp5mzhAnMlrG7CSxM6EuIqA="
 "ReturnValue": "",
 "Error": null
```

If you want to call a contract method by creating a proposal and released it, the released transaction result could be confusing, you can use another aelf-command sub-command to get the readable result;

Take the example above which has transferred token by proposal, transferred result can be viewed by decoding the Logs field in the transaction result. Use aelf-command event to decode the results.

Pass the transaction id as a parameter:

The Result field is the decoded result.

For more details, check the descriptions of aelf-command event.

22.2.6 deploy - Deploy a smart contract

This command has been deprecated, use aelf-command send or aelf-command proposal instead Examples:

1. Use Genesis Contract to deploy a new smart contract

```
$ aelf-command get-chain-status

√ Succeed

      "ChainId": "AELF",
      "Branches": {
            "41a8a1ebf037197b7e2f10a67d81f741d46a6af41775bcc4e52ab855c58c4375": 8681551,

# use GenesisContractAddress as a parameter of aelf-command send
# use contract method `DeploySmartContract` if the chain you are connecting to.
 →requires no limit of authority
$ aelf-command send 2gaQh4uxg6tzyH1ADLoDxvHA14FMpzEiMqsQ6sDG5iHT8cmjp8_
 →DeploySmartContract

✓ Fetching contract successfully!

If you need to pass file contents as a parameter, you can enter the relative or ...
 →absolute path of the file
Enter the params one by one, type `Enter` to skip optional param:
```

(continues on next page)

22.2. Commands 537

- You must input contract method parameters in the prompting way, note that you can input a relative or absolute path of contract file to pass a file to aelf-command, aelf-command will read the file content and encode it as a base64 string.
- After call ProposeNewContract, you can get proposal id and proposedContractInputHash later by running

```
$ aelf-command event..
-34184cbc27c95bbc0a1bd676192c3afc380740ab61626e5d428ae17faf9ea984
The results returned by
Transaction: 34184cbc27c95bbc0a1bd676192c3afc380740ab61626e5d428ae17faf9ea984 is:

✓ Succeed!
```

This command get the Log field of a transaction result and describilize the Log field with the correspond protobuf descriptors.

A transaction may be related with several Contract Method's events, so the transaction result can include several Logs.

In each item:

- Address: the contract address.
- Name: name of event published from related contract method.
- Indexed: indexed data of event in type of base64
- NoIndexed: no indexed data of event in type of base64.
- Result: the decoded result, this is readable and you can use it and get what the fields means inside the Result by reading the contract documents or contract related protobuf files. In this example, you can read the protobuf file;

22.2.8 send - Send a transaction

```
$ aelf-command send
✓ Enter the the URI of an AElf node ... http://13.231.179.27:8000
✓ Enter a valid wallet address, if you do not have, create one by aelf-command create.
→... D3vSjRYL8MpeRpvUDy85ktXijnBe2tHn8NTACsggUVteQCNGP
✓ Enter the password you typed when creating a wallet ... *******
\checkmark Enter contract name (System contracts only) or the address of contract ... AElf.
→ContractNames.Token

✓ Fetching contract successfully!

? Pick up a contract method: Transfer
If you need to pass file contents as a parameter, you can enter the relative or_
→absolute path of the file
Enter the params one by one, type `Enter` to skip optional param:
? Enter the required param <to>: C91b1SF5mMbenHZTfdfbJSkJcK7HMjeiuwfQu8qYjGsESanXR
? Enter the required param <symbol>: ELF
? Enter the required param <amount>: 100000000
? Enter the required param <memo>: 'test command'
The params you entered is:
  "to": "C91b1SF5mMbenHZTfdfbJSkJcK7HMjeiuwfQu8qYjGsESanXR",
  "symbol": "ELF",
  "amount": 100000000,
  "memo": "'test command'"

✓ Succeed!

22.2.14 console - Open an interactive console

22.2.15 dapp-server - Start a socket.io server for supplying services for dApps

If you're developing a dApp and you need an environment to hold wallet info and connect to the AEIf chain, you can use this sub-command to start a server for dApp local development.

```
$ aelf-command dapp-server
AElf [Info]: DApp server is listening on port 35443

# or listen on a specified port
$ aelf-command dapp-server --port 40334
AElf [Info]: DApp server is listening on port 40334
```

This server uses Socket.io to listen on local port 35443 and you can use aelf-bridge to connect to this server like this:

```
import AElfBridge from 'aelf-bridge';
const bridgeInstance = new AElfBridge({
   proxyType: 'SOCKET.IO',
   socketUrl: 'http://localhost:35443',
   channelType: 'ENCRYPT'
});
// connect to dapp-server
bridgeInstance.connect().then(console.log).catch(console.error);
```

checkout more information in aelf-bridge and aelf-bridge-demo.

22.2. Commands 545

CHAPTER 23

Wallet and Block Explorer

23.1 Explorer

Github

Currently, the explorer provides functions such as viewing blocks, transactions, purchasing resources, voting and node campaigning as well as viewing contracts.

23.2 iOS/Android Wallet

iOS/Android Wallet provides basic asset management and cross-chain trading capabilities. It also provides an open application platform for developers to access the wallet according to the usage document of the wallet SDK.

23.3 Web Wallet

Github

The Web Wallet provides basic transaction related functionality.

23.3.1 Explorer-api

To get more informantion by code

Block

Get Block List

CHAPTER 24

aelf-web-extension

You can get more information in Github

24.1 For User

release version, please waiting

dev version

If you are using qq browser,etc, you can add the extention too.

24.1.1 Notice

Note: Using File:/// protocol may can not use the extension // https://developer.chrome.com/extensions/match_patterns Note: Access to file URLs isn't automatic. The user must visit the extensions management page and opt in to file access for each extension that requests it.

24.2 For Dapp Developers

24.2.1 Interaction Flow

- Make sure the user get the Extension
- Connect Chain
- Initialize Contract
- Call contract methods

24.2.2 How to use

If you need complete data structure. you can click here

- Check Extension Demo
- GET_CHAIN_STATUS
- CALL_AELF_CHAIN
- LOGIN
- INIT_AELF_CONTRACT
- CALL_AELF_CONTRACT / CALL_AELF_CONTRACT_READONLY
- CHECK_PERMISSION
- SET_CONTRACT_PERMISSION
- REMOVE_CONTRACT_PERMISSION
- REMOVE_METHODS_WHITELIST

24.3 Data Format

```
NightElf = {
   histories: [],
    keychain: {
        keypairs: [
                name: 'your keypairs name',
                address: 'your keypairs address',
                mnemonic: 'your keypairs mnemonic',
                privateKey: 'your keupairs privateKey',
                publicKey: {
                    x: 'you keupairs publicKey',
                    y: 'you keupairs publicKey'
                }
            }
        ],
        permissions: [
            {
                chainId: 'AELF',
                contractAddress: 'contract address',
                contractName: 'contract name',
                description: 'contract description',
                github: 'contract github',
                whitelist: {
                    Approve: {
                        parameter1: 'a',
                        parameter2: 'b',
                        parameter3: 'c'
                }
            }
        ]
    }
```

24.3.1 Demo of Checking the Extension

```
let nightElfInstance = null;
class NightElfCheck {
   constructor() {
        const readyMessage = 'NightElf is ready';
        let resovleTemp = null;
        this.check = new Promise((resolve, reject) => {
            if (window.NightElf) {
                resolve (readyMessage);
            setTimeout(() => {
                reject({
                    error: 200001,
                    message: 'timeout / can not find NightElf / please install the_
→extension'
                });
            }, 1000);
            resovleTemp = resolve;
        });
        document.addEventListener('NightElf', result => {
            console.log('test.js check the status of extension named nightElf: ',_
→result);
            resovleTemp(readyMessage);
        });
    static getInstance() {
        if (!nightElfInstance) {
            nightElfInstance = new NightElfCheck();
            return nightElfInstance;
        return nightElfInstance;
    }
const nightElfCheck = NightElfCheck.getInstance();
nightElfCheck.check.then(message => {
    // connectChain -> Login -> initContract -> call contract methods
});
```

24.3.2 GET_CHAIN_STATUS

You can see the demo ./devDemos/test.html. [demo.js just a draft]

If you want to check Token Transfer Demo. You can click here

The methods calls act the same as the methods call of the aelf-sdk.js

Note: '...' stands for omitted data.

24.3. Data Format 555

24.3.3 CALL AELF CHAIN

24.3.4 LOGIN

```
aelf.login({
   appName: 'hzzTest',
   chainId: 'AELF',
   payload: {
       method: 'LOGIN',
        contracts: [{
           chainId: 'AELF',
            contractAddress: '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
            contractName: 'token',
            description: 'token contract',
            github: ''
        }, {
            chainId: 'AELF TEST',
            contractAddress: '2Xg2HKh8vusnFMQsHCXW1q3vys5JxG5ZnjiGwNDLrrpb9Mb',
            contractName: 'TEST contractName',
            description: 'contract description',
            github: ''
       } ]
}, (error, result) => {
```

```
console.log('login>>>>>>>', result);
});
// keychain = {
      keypairs: [{
//
//
           name: 'your keypairs name',
//
           address: 'your keypairs address',
//
           mnemonic: 'your keypairs mnemonic',
//
           privateKey: 'your keypairs privateKey'
//
           publicKey: {
//
              x: 'f79c25eb.....',
//
              y: '7fa959ed.....'
//
           }
//
      }],
//
      permissions: [{
//
           appName: 'hzzTest',
           address: 'your keyparis address',
//
//
           contracts: [{
//
              chainId: 'AELF',
//
              contractAddress: '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
//
              contractName: 'token',
//
              description: 'token contract',
//
              github: ''
//
           }],
//
           domain: 'Dapp domain'
//
       } ]
// }
```

24.3.5 INIT_AELF_CONTRACT

```
// In aelf-sdk.js wallet is the realy wallet.
// But in extension sdk, we just need the address of the wallet.
const tokenContract;
const wallet = {
   address: '2JqnxvDiMNzbSgme2oxpqUFpUYfMjTpNBGCLP2CsWjpbHdu'
// It is different from the wallet created by Aelf.wallet.getWalletByPrivateKey();
// There is only one value named address;
aelf.chain.contractAtAsync(
    '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
   wallet,
    (error, result) => {
        console.log('>>>>>>> contractAtAsync >>>>>>>);
        console.log(error, result);
       tokenContract = result;
    }
);
// result = {
//
      Approve: f (),
//
      Burn: f (),
//
      ChargeTransactionFees: f (),
//
      ClaimTransactionFees: f (),
//
       . . . .
// }
```

24.3. Data Format 557

24.3.6 CALL AELF CONTRACT / CALL AELF CONTRACT READONLY

```
// tokenContract from the contractAsync
tokenContract.GetBalance.call(
       symbol: 'AELF',
       owner: '65dDNxzcd35jESiidFXN5JV8Z7pCwaFnepuYQToNefSgqk9'
    (err, result) => {
       console.log('>>>>>>>, result);
   }
);
tokenContract.Approve(
   {
       symbol: 'AELF',
       spender: '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
       amount: '100'
   },
    (err, result) => {
       console.log('>>>>>>', result);
);
// If you use tokenContract.GetBalance.call this method {f is} only applicable to_
→queries that do not require extended authorization validation.(CALL_AELF_CONTRACT_
→READONLY)
// If you use tokenContract.Approve this requires extended authorization validation_
// tokenContract.GetBalance.call(payload, (error, result) => {})
// result = {
//
     symbol: "AELF",
//
      owner: "65dDNxzcd35jESiidFXN5JV8Z7pCwaFnepuYQToNefSgqk9",
//
      balance: 0
// }
```

24.3.7 CHECK_PERMISSION

```
aelf.checkPermission({
   appName: 'hzzTest',
   type: 'address', // if you did not set type, it aways get by domain.
   address: '4WBgSL2fSem9ABD4LLZBpwP8eEymVSS1AyTBCqXjt5cfxXK'
}, (error, result) => {
   console.log('checkPermission>>>>>>>', result);
});
// result = {
      permissions:[
          {
              address: '...',
              appName: 'hzzTest',
//
              contracts: [{
//
                chainId: 'AELF',
```

559

```
//
                   contractAddress: '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
//
                    contractName: 'token',
//
                    description: 'token contract',
                    github: ''
//
               },
//
                    chainId: 'AELF TEST',
                    contractAddress: 'TEST contractAddress',
//
                    contractName: 'TEST contractName',
                   description: 'contract description',
                   github: ''
//
               }],
//
               domian: 'Dapp domain'
//
           }
//
       ]
// }
```

24.3.8 SET CONTRACT PERMISSION

24.3. Data Format

```
aelf.setContractPermission({
   appName: 'hzzTest',
   hainId: 'AELF',
   payload: {
        address: '2JqnxvDiMNzbSgme2oxpqUFpUYfMjTpNBGCLP2CsWjpbHdu',
        contracts: [{
            chainId: 'AELF',
            contractAddress: 'TEST contractAddress',
            contractName: 'AAAA',
            description: 'contract description',
            github: ''
        } ]
}, (error, result) => {
   console.log('>>>>>>', result);
});
// keychain = {
//
      keypairs: {...},
//
       permissions: [{
           appName: 'hzzTest',
//
           address: 'your keyparis address',
//
           contracts: [{
              chainId: 'AELF',
//
               contractAddress: '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
               contractName: 'token',
               description: 'token contract',
//
               github: '',
               whitelist: {}
//
           },
               chainId: 'AELF',
               contractAddress: 'TEST contractAddress',
               contractName: 'AAAA',
//
               description: 'contract description',
//
               github: ''
                                                                           (continues on next page)
```

```
// }],
// domain: 'Dapp domain'
// }]
// }
```

24.3.9 REMOVE CONTRACT PERMISSION

```
aelf.removeContractPermission({
   appName: 'hzzTest',
   chainId: 'AELF',
   payload: {
        contractAddress: '2Xg2HKh8vusnFMQsHCXW1q3vys5JxG5ZnjiGwNDLrrpb9Mb'
}, (error, result) => {
   console.log('removeContractPermission>>>>>>>,, result);
});
// keychain = {
//
      keypairs: {...},
//
      permissions: [{
//
           appName: 'hzzTest',
//
           address: 'your keyparis address',
//
           contracts: [{
//
              chainId: 'AELF',
//
              contractAddress: '4rkKQpsRFt1nU6weAHuJ6CfQDqo6dxruU3K3wNUFr6ZwZYc',
//
              contractName: 'token',
//
              description: 'token contract',
              github: ''
//
           }],
//
           domain: 'Dapp domain'
//
      } ]
// }
```

24.3.10 REMOVE METHODS WHITELIST

```
aelf.removeMethodsWhitelist({
   appName: 'hzzTest',
   chainId: 'AELF',
   payload: {
        contractAddress: '2Xg2HKh8vusnFMQsHCXW1q3vys5JxG5ZnjiGwNDLrrpb9Mb',
       whitelist: ['Approve']
}, (error, result) => {
   console.log('removeWhitelist>>>>>>', result);
});
// keychain = {
//
      keypairs: {...},
//
      permissions: [{
//
          appName: 'hzzTest',
//
          address: 'your keyparis address',
//
          contracts: [{
//
              chainId: 'AELF',
```

24.4 For Extension Developers

1. Download the code

```
git clone https://github.com/hzz780/aelf-web-extension.git
```

2. Install dependent

```
npm install
```

3. Run webpack

```
webpack -w
```

4. Add to the browser

```
open development mode, add the webpack output app/public.
```

24.5 Project Information

We use ECDH to use public key to encryt data and private key to decrypt data.

DevOps

25.1 Open source development

We want to stay as open as possible during AEIf's development. For this we follow a certain amount rules and guidelines to try and keep the project as accessible as possible. Our project is open source and we publish our code as well as current issues online. It is our responsibility to make it as transparent as possible.

AEIf is a collaborative project and welcomes outside opinion and requests/discussion for modifications of the code, but since we work in an open environment all collaborator need to respect a certain standard. We clarify this in the following standard:

•

We encourage collaborators that want to participate to first read the white paper and the documentations to understand the ideas surrounding AEIf. Also a look at our code and architecture and the way current functionality has been implemented. After this if any questions remain, you can open an issues on GitHub stating as clearly as possible what you need to clarify.

Finally, any collaborator wanting to participate in the development should open a pull request following our rules. It will be formally reviewed and discussed through GitHub and if validated by core members of AEIf, can be merged.

25.2 Deployment

For versioning we use the semver versioning system: https://semver.org

Daily build

Integrated with github we have cron job that will publish the latest version of devs myget packets.

- MyGet: https://www.myget.org/gallery/aelf-project-dev

Release branch

Nuget: https://www.nuget.org/profiles/AElf

25.3 Testing

Testing is one of the most important aspects of software development. Non tested software is difficult to improve. There are two main types of testing that we perform: unit testing and performance testing. The unit testing covers functionality and protocol, which is an essential part of a blockchain system. The performance tests are also very important to show that modifications have not impacted the speed at which our nodes process incoming transactions and blocks.

25.3.1 Unit testing

To ensure the quality of our system and avoid regression, as well as permit safe modifications, we try to cover as much of our functionality as possible through unit tests. We mostly use the xUnit framework and follow generally accepted best practices when testing. Our workflow stipulates that for any new functionality, we cover it with tests and make sure other unit tests.

25.3.2 Perf testing

The performance testing is crucial to AEIf since a strong point of our system is speed.

25.4 Monitoring

- Server monitoring: Zabbix monitors instances of aelf metrics like cpu, db...
- Chain monitoring: project on github with Grafana dashboard from Influxdb
- Akka monitoring: monitor actors.

CHAPTER 26

QuickStart

26.1 Manual build & run the sources

This method is not as straightforward as the docker quickstart but is a lot more flexible. If your aim is to develop some dApps it's better you follow these more advanced ways of launching a node. This section will walk you through configuring, running and interacting with an AElf node.

First, if you haven't already done it, clone our repository

```
git clone https://github.com/AElfProject/AElf.git aelf
cd aelf/src
```

Navigate into the newly created aelf directory.

26.1.1 Generating the nodes account

First you need to install the aelf-command command packet. Open a terminal and enter the following command:

```
npm i -g aelf-command
```

Windows Note: it's possible that you get some errors about python not being installed, you can safely ignore these.

After installing aelf-command you can use the following command to create an account/key-pair:

```
aelf-command create
```

The command prompts for a password, enter it and don't forget it. The output of the command should look something like this:

```
Your wallet info is :
Mnemonic : great mushroom loan crisp ... door juice embrace
Private Key
                 : e038eea7e151eb451ba2901f7...b08ba5b76d8f288
            : 0478903d96aa2c8c0...
Public Key
 →6a3e7d810cacd136117ea7b13d2c9337e1ec88288111955b76ea
```

```
Address : 2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR5oGin1sys6H

✓ Save account info into a file? ... no / yes

✓ Enter a password ... ********

✓ Confirm password ... *******

✓
Account info has been saved to "/Users/xxx/.local/share/**aelf**/keys/

→2Ue31YTuB5Szy7cnr...Gi5uMQBYarYUR5oGin1sys6H.json"
```

In the next steps of the tutorial you will need the **Public Key** and the **Address** for the account you just created. You'll notice the last line of the commands output will show you the path to the newly created key. The **aelf** is the data directory (datadir) and this is where the node will read the keys from.

Note that a more detailed section about the cli can be found command line interface.

26.1.2 Node configuration

We have one last step before we can run the node, we have to set up some configuration. Navigate into the **AEIf.Launcher** directory:

```
cd AElf.Launcher/
```

This folder contains the default **appsettings.json** file, with some default values already given. There's still some fields that are empty and that need configuring. This will require the information printed during the creation of the account. Open the **appsettings.json** file and edit the following sections.

The account/key-pair associated with the node we are going to run:

```
{
   "Account":
   {
        "NodeAccount": "2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR5oGin1sys6H",
        "NodeAccountPassword": "*******"
    },
}
```

The NodeAccount field corresponds to the address, you also have to enter the password that you entered earlier.

```
{
  "InitialMinerList" : [
        "0478903d96aa2c8c0...6a3e7d810cacd136117ea7b13d2c9337e1ec88288111955b76ea"
    ],
}
```

This is a configuration that is used to specify the initial miners for the DPoS consensus, for now just configure one, it's the accounts public key that was printed during the account creation.

Note that if your Redis server is on another host listening on a different port than the default, you will also have to configure the connection strings (port/db number):

```
"ConnectionStrings": {
    "BlockchainDb": "redis://localhost:6379?db=1",
    "StateDb": "redis://localhost:6379?db=1"
    },
}
```

We've created an account/key-pair and modified the configuration to use this account for the node and mining, we're now ready to launch the node.

26.1.3 Launch and test

Now we will build and run the node with the following commands:

```
dotnet build AElf.Launcher.csproj --configuration Release
dotnet bin/Release/net6.0/AElf.Launcher.dll > aelf-logs.logs &
cd ..
```

You now should have a node that's running, to check this run the following command that will query the node for its current block height:

```
aelf-command get-blk-height -e http://127.0.0.1:8000
```

26.1.4 Cleanup

To stop the node you can simply find and kill the process:

On mac/Linux:

```
ps -f | grep [A]Elf.Launcher.dll | awk '{print $2}'
```

On Windows (Powershell):

```
Get-CimInstance Win32_Process -Filter "name = 'dotnet.exe'" | select CommandLine,

→ProcessId | Where-Ob
ject {$_.CommandLine -like "*AElf.Launcher.dll"} | Stop-Process -ID {$_.ProcessId}
```

If needed you should also clean your redis database, with either of the following commands:

```
redis-cli FLUSHALL (clears all dbs)
```

```
redis-cli -n <database_number> FLUSHDB (clear a specified db)
```

26.1.5 Extra

For reference and after you've started a node, you can get infos about an account with the *aelf-command console* command:

```
aelf-command console -a 2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR5oGin1sys6H

✓ Enter the password you typed when creating a wallet ... *******

✓ Succeed!

Welcome to aelf interactive console. Ctrl + C to terminate the program. Double tap_ → Tab to list objects

NAME | DESCRIPTION AElf | imported from aelf-sdk aelf | the instance of an aelf-sdk, connect to
```

| http://127.0.0.1:8000 _account | the instance of an AElf wallet, address | is | 2Ue31YTuB5Szy7cnr3SCEGU2gtGi5uMQBYarYUR... | 5oGin1sys6H

Developing smart contracts

AEIf is part of a relatively new software type called the blockchain. From a high-level perspective, a blockchain is a network of interconnected nodes that process transactions in order to form blocks. Transactions are usually broadcast to the network by sending them to a node; this node verifies the transaction, and if it's correct will broadcast it to other nodes. The client that sent the transaction can be of many types, including a browser, script or any client that can connect and send HTTP requests to a node.

Internally blockchains keep a record of all the transactions ever executed by the network, and these transactions are contained in cryptographically linked blocks. AElf uses a DPoS consensus type in which miners collect transactions and, according to a schedule, package them into blocks that are broadcast to the network. These linked blocks effectively constitute the blockchain (here, blockchain refers to the data structure rather than the software). In AElf the transaction and blocks are usually referred to as **chain data**.

Smart contracts are pieces of code that can be executed by transactions, and that will usually modify their associated state. In other words, the execution of transactions modifies the current values of the contracts state. The set of all the state variables of all the contracts is referred to as a **state data**.

27.1 Contracts in AEIf

Conceptually, AEIf smart contracts are entities composed of essentially three things: **action** methods, **view** methods, and the contracts **state**. Actions represent logic that modifies the state of the contract, and views are used to fetch the current state of the contract without modifying it. Theses two types of methods are executed when a transaction is being processed by a node, usually when executing a block or producing it.

In practice, an aelf contract is written in C# with some parts that are generated from a **protobuf definition**. The protobuf is used to define the contract's methods and data types. By using a custom plugin, the protobuf compiler generates the C# code that is later extended by the contract author to implement logic.

27.2 Development

Currently, the primary language supported by an AEIf node is C#. The provided C# SDK contains all essential elements for writing smart contracts, including communication with the execution context, access to state and storage primitives.

Writing a contract boils down to creating a protobuf definition and a C# project (referred to sometimes as a Class Library in the C# world) and referencing the SDK. Only a small subset of the C# language is needed to develop a contract.

This series of articles mainly uses AEIf Boilerplate as a smart contract development framework. It takes care of the build process for the contract author and provides some well-defined location to place the contract files. The first article will show you how to set up this environment. After the setup, the next three articles will walk you through creating, testing, and deploying a contract. Later articles will focus on exposing more complex functionality.

27.2.1 Setup

AEIf Boilerplate is the go-to environment for creating and testing smart contracts. It takes care of including your contract files in the build system and linking the appropriate development SDK. Boilerplate also takes care of generating the csharp code from the proto definition.

This article will get you started with development on Boilerplate. It contains the following items: - how to clone, build, and run AElf Boilerplate. - how to run the Hello World contract tests. - a brief presentation of Boilerplate.

Environment

IDE

Strictly speaking, you don't need an IDE for this tutorial, but it is highly recommended. If you don't already have one you can try Visual Studio Code (vscode) with the C# extension: - installation instructions for vscode here. - working with C# extension here.

You can, of course, use your favorite C# IDE, most of the steps described here and in later articles do not need IDE support.

Clone the repository

The following command will clone AElf Boilerplate into a **aelf-boilerplate** folder with Boilerplate's code inside it, open a terminal and enter the following command:

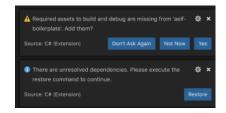

```
git clone https://github.com/AElfProject/aelf-boilerplate
```

The boilerplate repo contains a framework for easy smart contract development as well as examples (some explained in this series of articles).

Build and run

Open the project

If not already done, open vscode and open the **aelf-boilerplate** folder. If asked to add some "required assets" say **yes**. There may also be some dependencies to restore: for all of them, choose **Restore**.

Open vscode's **Integrated Terminal** and build the project with the following command. Note: you can find out more about vscode's terminal here.

Install script

As stated earlier, Boilerplate takes care of the C# code generation and thus has a dependency on protobuf. If you don't already have it installed, run the following script from withing the **aelf-boilerplate** folder:

```
# Mac or Linux
sh chain/scripts/install.sh

# Windows
# open a PowerShell console as administrator
chain/scripts/install.ps1
```

{% hint style="info" %} If you prefer or have problems, you can refer to the following guide to manually install protobuf on your system. {% endhint %}

Build and run

The next step is to build Boilerplate and all the contracts to ensure everything is working correctly. Once everything is built, we'll run Boilerplate's internal node.

```
# enter the Launcher folder and build
cd chain/src/AElf.Boilerplate.Launcher/

# build
dotnet build

# run the node
dotnet run --no-build bin/Debug/net6.0/AElf.Boilerplate.Launcher
```

{% hint style="warning" %} When running Boilerplate, you might see some errors related to an incorrect password, to solve this, you need to backup your data-dir/keys/ folder and start with an empty keys folder. Once you've cleaned the keys, stop and restart the node with the dotnet run command shown above. {% endhint %}

At this point, the smart contracts have been deployed and are ready to be called (Boilerplate has a functioning API). You should see the node's logs in the terminal and see the node producing blocks. You can now stop the node by killing the process (usually **control-c** or **ctrl-c** in the terminal).

Run tests

Boilerplate makes it easy to write unit tests for your contracts. Here we'll take the tests of the Hello World contract included in Boilerplate as an example. To run the tests, navigate to the **AElf.Contracts.HelloWorldContract.Test** folder and run:

```
cd ../../test/AElf.Contracts.HelloWorldContract.Test/
dotnet test
```

The output should look somewhat like this, meaning that the tests have successfully executed:

```
Test Run Successful.
Total tests: 1
Passed: 1
Total time: 2.8865 Seconds
```

At this point, you have successfully downloaded, built, and run Boilerplate. You have also run the HelloWorld contract's tests that are included in Boilerplate. Later articles will show you how to add a contract and its tests and add it to the deployment process.

More on Boilerplate

Boilerplate is an environment that is used to develop smart contracts and dApps. After writing and testing your contract on Boilerplate, you can deploy it to a running AElf chain. Internally Boilerplate will run an AElf node that will automatically have your contract deployed on it at genesis.

Boilerplate is composed of two root folders: **chain** and **web**. This series of tutorial articles focuses on contract development so we'll only go into the details of the **chain** part of Boilerplate. Here is a brief overview of the folders:

```
chain

src

contract

AElf.Contracts.HelloWorldContract.csproj

HelloWorldContract.cs

HelloWorldContractState.cs

...

protobuf

hello_world_contract.proto
...

test

AElf.Contracts.HelloWorldContract.Test

AElf.Contracts.HelloWorldContract.Test

HelloWorldContracts.test.csproj

HelloWorldContractTest.cs
```

The hello world contract and its tests are split between the following folders: - **contract**: this folder contains the csharp projects (.csproj) along with the contract implementation (.cs files). - **protobuf**: contains the .proto definition of the contract. - **test**: contains the test project and files (basic xUnit test project).

You can use this layout as a template for your future smart contracts. Before you do, we recommend you follow through all the articles of this series.

{% hint style="info" %} You will also notice the **src** folder. This folder contains Boilerplate's modules and the executable for the node. {% endhint %}

Next

You've just seen a short introduction on how to run a smart contract that is already included in Boilerplate. The next article will show you a complete smart contract and extra content on how to organize your code and test files.

{% hint style="warning" %} All production contracts (contracts destined to be deployed to a live chain) must go through a complete review process by the contract author and undergo proper testing. It is the author's responsibility to check the validity and security of his contract. The author should not simply copy the contracts contained in Boilerplate; it's the author's responsibility to ensure the security and correctness of his contracts. {% endhint %}

27.2.2 Transaction execution context

This article will present some of the functionality available to smart contract developers that can help them implement common scenarios.

When executing, transactions trigger the logic contained inside smart contracts. The smart contract execution is mostly sandboxed (it's an isolated environment), but some elements are accessible to the smart contract author through the **execution context**.

Before we get started with the examples, it's important to know a little about the execution model of transactions; this will help you understand some concepts explained in this article. As a reminder this is what a transaction in AElf looks like (simplified):

When users create and send a transaction to a node, it will eventually be packaged in a block. When this block is executed, the transactions it contains are executed one by one.

Each transaction can generate new transactions called inline transactions (more on this in the next article). When this happens, the generated inline transactions are executed right after the transaction that generated them. For example, let's consider the following scenario: a block with two transactions, let's say **tx1** and **tx2**, where **tx1** performs two inline calls. In this situation, the order of execution will be the following:

٠,,

- 1. execute tx1
- Execute first inline
- 3. Execute second Inline
- 4. execute tx2 "

This is important to know because, as we will see next, some of the execution context's values change based on this logic.

Origin, Sender and Self

- Origin: the address of the sender (signer) of the transaction being executed. Its type is an AEIf address. It corresponds to the **From** field of the transaction. This value never changes, even for nested inline calls. This means that when you access this property in your contract, it's value will be the entity that created the transaction (user or smart contract through an inline call)
- Self: the address of the contract currently being executed. This changes for every transaction and inline transaction.

• **Sender**: the address sending the transaction. If the transaction execution does not produce any inline transactions, this will always be the same. But if one contract calls another with an inline transaction, the sender will be the contract that is calling.

To use these values, you can access them through the **Context** property.

```
Context.Origin
Context.Sender
Context.Self
```

Useful properties

There are other properties that can be accessed through the context:

- transaction ID: this is the id of the transaction that is currently being executed. Note that inline transactions have their own ID.
- chain ID: the ID of the current chain, this can be useful in the contract that needs to implement cross-chain scenarios
- current height: the height of the block that contains the transaction currently executing.
- current block time: the time included in the header of the current block.
- previous block hash: the hash of the block that precedes the current.

Useful methods

Logging and events:

Fire log event - these are logs that can be found in the transaction result after execution.

```
public override Empty Vote(VoteMinerInput input)
{
    // for example the election system contract will fire a 'voted' event
    // when a user calls vote.
    Context.Fire(new Voted
    {
        VoteId = input.VoteId,
        VotingItemId = votingRecord.VotingItemId,
        Voter = votingRecord.Voter
        //...
    });
}
```

Application logging - when writing a contract, it is useful to be able to log some elements in the applications log file to simplify development. Note that these logs are only visible when the node executing the transaction is build in **debug** mode.

```
}
```

Get contract address

It's sometimes useful to get the address of a system contract; this can be done as follows:

```
public override Empty AddBeneficiary(AddBeneficiaryInput input)
{
    // In the profit contract, when adding a 'beneficiary', the method will get_
    -the address of the token holder
    // contract from its name, to perform an assert.

Assert(Context.Sender == Context.

GetContractAddressByName(SmartContractConstants.TokenHolderContractSystemName),
    "Only manager can add beneficiary.");
}
```

Recovering the public key

Recovering the public key: this can be used for recovering the public key of the transaction Sender.

```
public override Empty Vote(VoteMinerInput input)
{
    // for example the election system contract will use the public key of the sender
    // to keep track of votes.
    var recoveredPublicKey = Context.RecoverPublicKey();
}
```

27.2.3 Internal contract interactions

There are essentially two reasons for interacting with other contracts:

- 1. to query their state.
- 2. to create an inline transaction, that is, a new transaction which will be executed after the original transaction.

Both of the two operations can be done in two ways:

- 1. using the **transaction execution context**.
- 2. adding a Contract Reference State to the contract, then using CSharpSmartContract.State to call methods.

Using the Context

Query state from other contracts

Let's see how to call the **GetCandidates** method of the **Election Contract** and get the return value directly in your contract code with the **Context** property that is available in every smart contract.

27.2. Development 575

There are several things to know before writing such code:

• Because this code references a type (**PubkeyList**) originally defined in the Election Contract (types are defined in a proto file, in this case, **election_contract.proto**), you at least need to reference messages defined in the .proto file in your contracts project.

Add these lines to your csproj file:

The **ContractMessage** tag means you just want to reference the messages defined in the specified .proto file.

- The Call method takes the three following parameters:
 - address: the address of the contract you're seeking to interact with.
 - methodName: the name of the method you want to call.
 - *message*: the argument for calling that method.
- Since the Election Contract is a system contract which deployed at the very beginning of AEIf blockchain, we can get its address directly from the Context property. If you want to call contracts deployed by users, you may need to obtain the address in another way (like hard code).

To send an inline transaction

Imagine you want to transfer some tokens from the contract you're writing, the necessary step is sending an inline transaction to MultiToken Contract, and the MethodName of this inline transaction needs to be Transfer

var tokenContractAddress = Context.GetContractAddressByName(SmartContractConstants.

→TokenContractSystemName);
Context.SendInline(tokenContractAddress, "Transfer", new TransferInput
{
 To = toAddress/* The address you wanna transfer to*/,
 Symbol = Context.Variables.NativeSymbol,// You will get "ELF" if this contract is.

→deployed in AElf main chain.
 Amount = 100_000_00000000,// 100000 ELF tokens.
 Memo = "Gift."// Optional
});

Again, because you have to reference a message defined by the m=Multi-Token contract proto file, you need to add these lines to the csproj file of your contract project.

This inline transaction will be executed after the execution of the original transaction. Check other documentation for more details about the inline transactions.

Using Contract Reference State

Using Contract Reference State is more convenient than using Context to do the interaction with another contract. Follow these three steps of preparation:

- 1. Add a related proto file(s) of the contract you want to call or send inline transactions to and rebuild the contract project. (like before, but we need to change the MSBUILD tag name, we'll see this later.)
- 2. Add an internal property of XXXContractReferenceState type to the State class of your contract.
- 3. Set the contract address to the Value of property you just added in step 2.

Let's see a demo that implements these steps: check the balance of ELF token of the current contract, if the balance is more significant than 100 000, request a random number from AEDPOS Contract.

First, reference proto files related to MultiToken Contract and acs6.proto (random number generation).

After rebuilding the contract project, we'll see following files appear in the Protobuf/Generated folder:

- Acs6.c.cs
- Acs6.g.cs
- TokenContract.c.cs
- TokenContract.g.cs

As you may guess, the entities we will use are defined in files above.

Here we will define two Contract Reference States, one for the token contract and one for the random number provider.

```
using AElf.Contracts.MultiToken;
using Acs6;
...
// Define these properties in the State file of current contract.
```

Life becomes very easy if we have these XXXContractReferenceState instances. Check the implementation.

```
// Set the Contract Reference States address before using it (again here, we already,
→have the system addresses for the token and ac6 contracts).
if (State.TokenContract.Value == null)
    State.TokenContract.Value =
        {\tt Context.GetContractAddressByName} \ ({\tt SmartContractConstants.}
→TokenContractSystemName);
if (State.ACS6Contract.Value == null)
    // This means we use the random number generation service provided by `AEDPoS.,
→Contract`.
    State.ACS6Contract.Value =
        {\tt Context.GetContractAddressByName}~({\tt SmartContractConstants.}
→ConsensusContractSystemName);
// Use `Call` method to query states from multi-token contract.
var balance = State.TokenContract.GetBalance.Call(new GetBalanceInput
    Owner = Context.Self, // The address of current contract.
    Symbol = "ELF" // Also, you can use Context. Variables. Native Symbol if this,
\rightarrow contract will deployed in AElf main chain.
});
if (balance.Balance > 100_000)
    // Use `Send` method to generate an inline transaction.
   State.ACS6Contract.RequestRandomNumber.Send(new RequestRandomNumberInput());
```

As you can see, it is convenient to call a method by using state property like this: State. Contract.method. Call(input).
